2.9	Development . . . . .	52

Documentation for version 0.3.0, updated on May 21, 2015.

## Overview

---

*libcbor* is a C library for parsing and generating CBOR, the general-purpose schema-less binary data format.

### Main features

- Complete RFC conformance<sup>1</sup>
- Robust C11 implementation
- Layered architecture offers both control and convenience
- Flexible memory management
- Proper handling of UTF-8
- No shared global state - threading friendly
- Full support for streams & incremental processing
- Extensive documentation and test suite
- No runtime dependencies, small footprint

---

<sup>1</sup> RFC conformance

---

## Contents

---

## 2.1 Getting started

Pre-built Linux packages are distributed from the libcbor website. For other platforms, you will need to compile it from source.

### 2.1.1 Building & installing libcbor

#### Prerequisites:

- C99 compiler
- CMake 2.8 or newer (might also be called `cmakesetup`, `cmake-gui` or `ccmake` depending on the installed version and system)
- C build system CMake can target (make, Apple Xcode, MinGW, ...)

**Note:** As of May 2015, not even the 2015 release candidate of Visual Studio supports C99. While CMake will be happy to generate a VS solution that you can play with, libcbor currently cannot be compiled using the MSVC toolchain. ICC, GCC under Cygwin, and MinGW's GCC will all work. The MinGW build process is described below.

#### Configuration options

A handful of configuration flags can be passed to `cmake`. The following table lists libcbor compile-time directives and several important generic flags.

Option	Meaning	Default	Possible values
<code>CMAKE_C_COMPILER</code>	C compiler to use	<code>cc</code>	<code>gcc</code> , <code>clang</code> , <code>clang-3.5</code> , ...
<code>CMAKE_INSTALL_PREFIX</code>	Installation prefix	System-dependent	<code>/usr/local/lib</code> , ...
<code>CUSTOM_ALLOC</code>	Allow custom <code>malloc</code> ?	ON	ON, OFF
<code>HUGE_FUZZ</code>	Fuzz test with 8GB of data	OFF	ON, OFF
<code>SANE_MALLOC</code>	Assume <code>malloc</code> will refuse unreasonable allocations	OFF	ON, OFF
<code>COVERAGE</code>	Generate test coverage instrumentation	OFF	ON, OFF
<code>PRETTY_PRINTER</code>	Include a pretty-printer implementation	ON	ON, OFF
<code>BUFFER_GROWTH</code>	Buffer growth factor	2	<code>&gt;1</code>

If you want to pass other custom configuration options, please refer to [http://www.cmake.org/Wiki/CMake\\_Useful\\_Variables](http://www.cmake.org/Wiki/CMake_Useful_Variables).

### Building using make

```
# Assuming you are in the directory where you want to build
cmake -DCMAKE_BUILD_TYPE=Release path_to_libcbor_dir
make cbor
```

Both the shared (`libcbor.so`) and the static (`libcbor.a`) libraries should now be in the `src` subdirectory.

In order to install the libcbor headers and libraries, the usual

```
make install
```

is what you're looking for. Root permissions are required on most systems.

### Portability

libcbor is highly portable and works on both little- and big-endian systems regardless of the operating system. After building on an exotic platform, you might wish to verify the result by running the [test suite](#). If you encounter any problems, please report them to the [issue tracker](#).

libcbor is known to successfully work on ARM Android devices. Cross-compilation is possible with `arm-linux-gnueabi-gcc`.

## 2.1.2 Linking with libcbor

If you include and linker paths include the directories to which libcbor has been installed, compiling programs that uses libcbor requires no extra considerations.

You can verify that everything has been set up properly by creating a file with the following contents

```
#include <cbor.h>
#include <stdio.h>

int main(int argc, char * argv[])
{
    printf("Hello from libcbor %s\n", CBOR_VERSION);
```

and compiling it

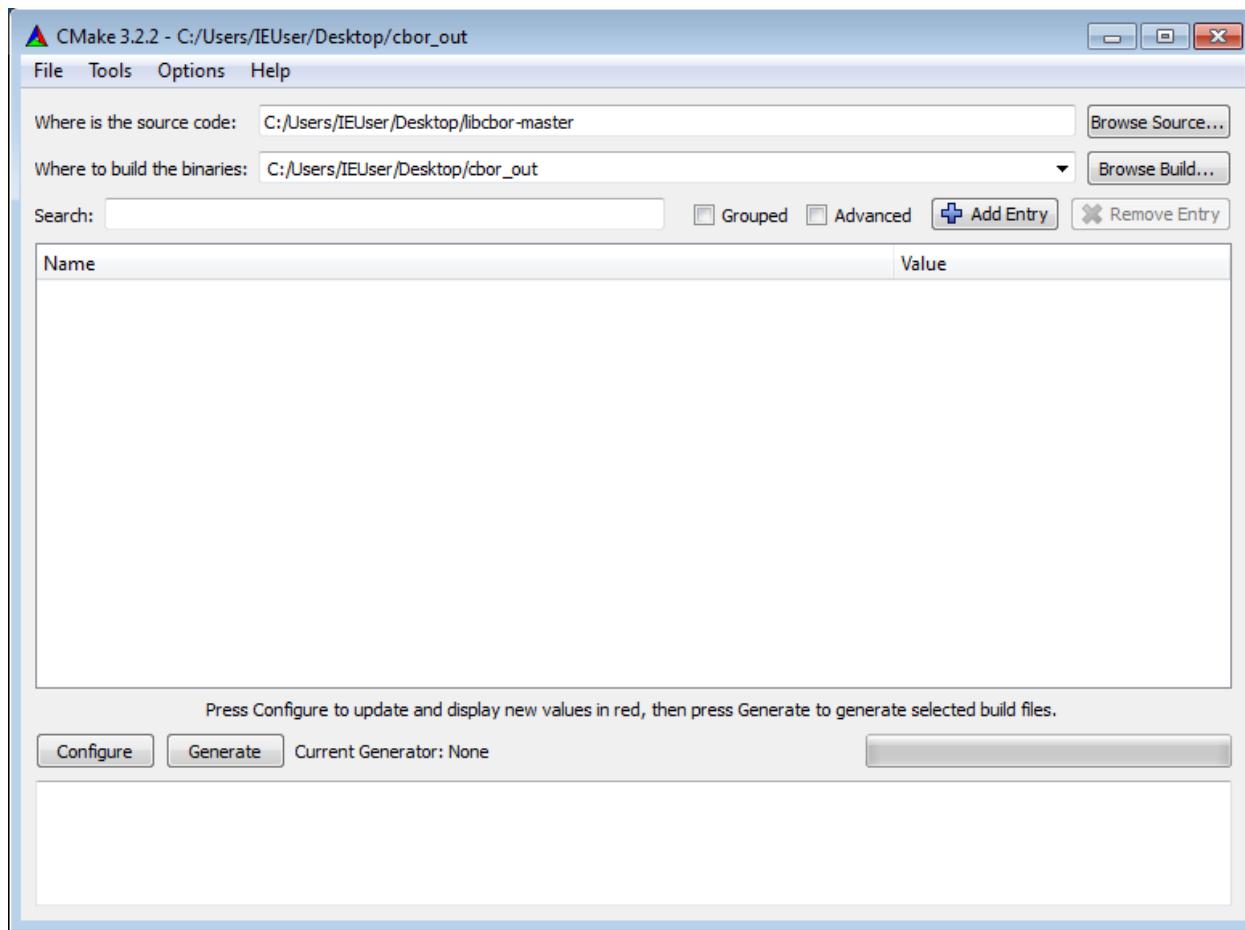

```
cc hello_cbor.c -lcbor -o hello_cbor
```

## 2.1.3 MinGW build instructions

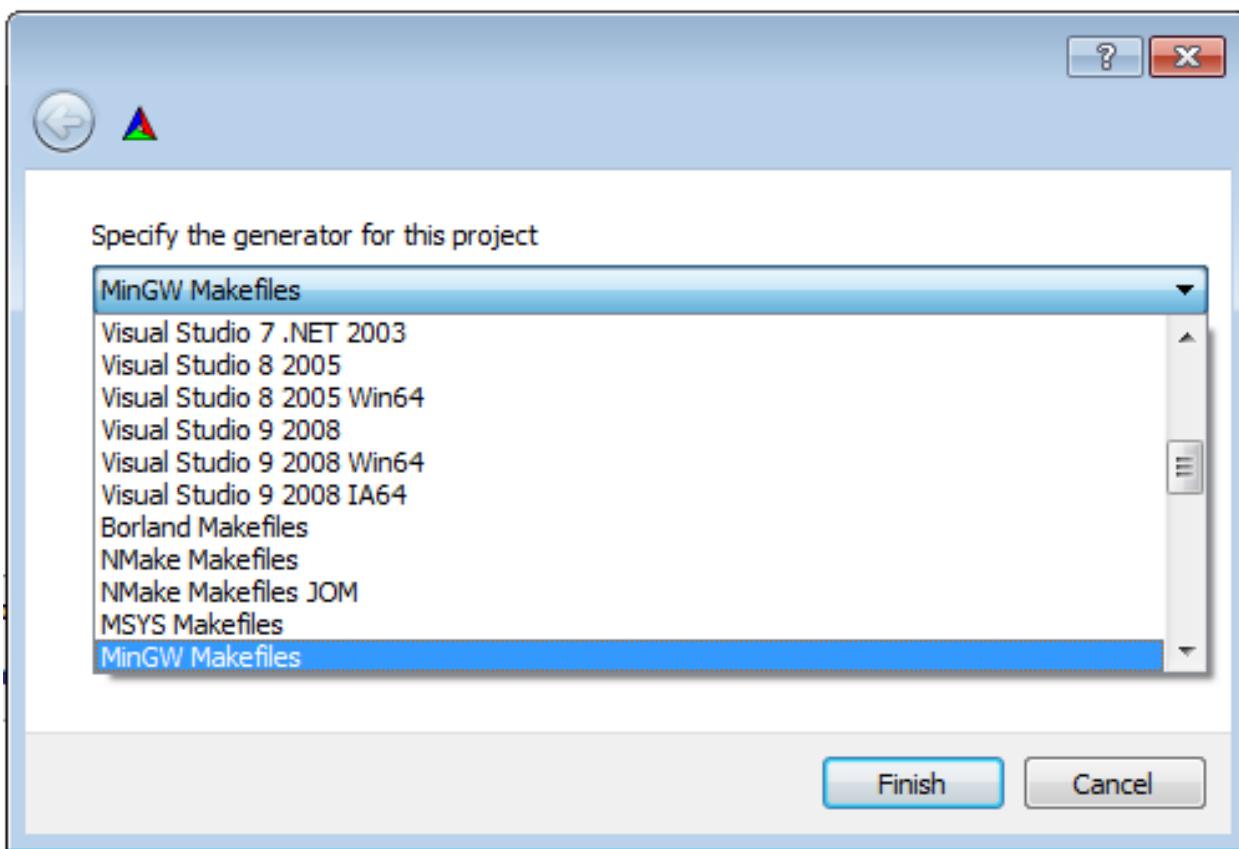

### Prerequisites:

- MinGW
- CMake GUI

First of all, create a folder that will be used for the output. For this demonstration, we will use `cbor_out`. Start CMake and select the source path and the destination folder.

Then hit the ‘Configure’ button. You will be prompted to select the build system:

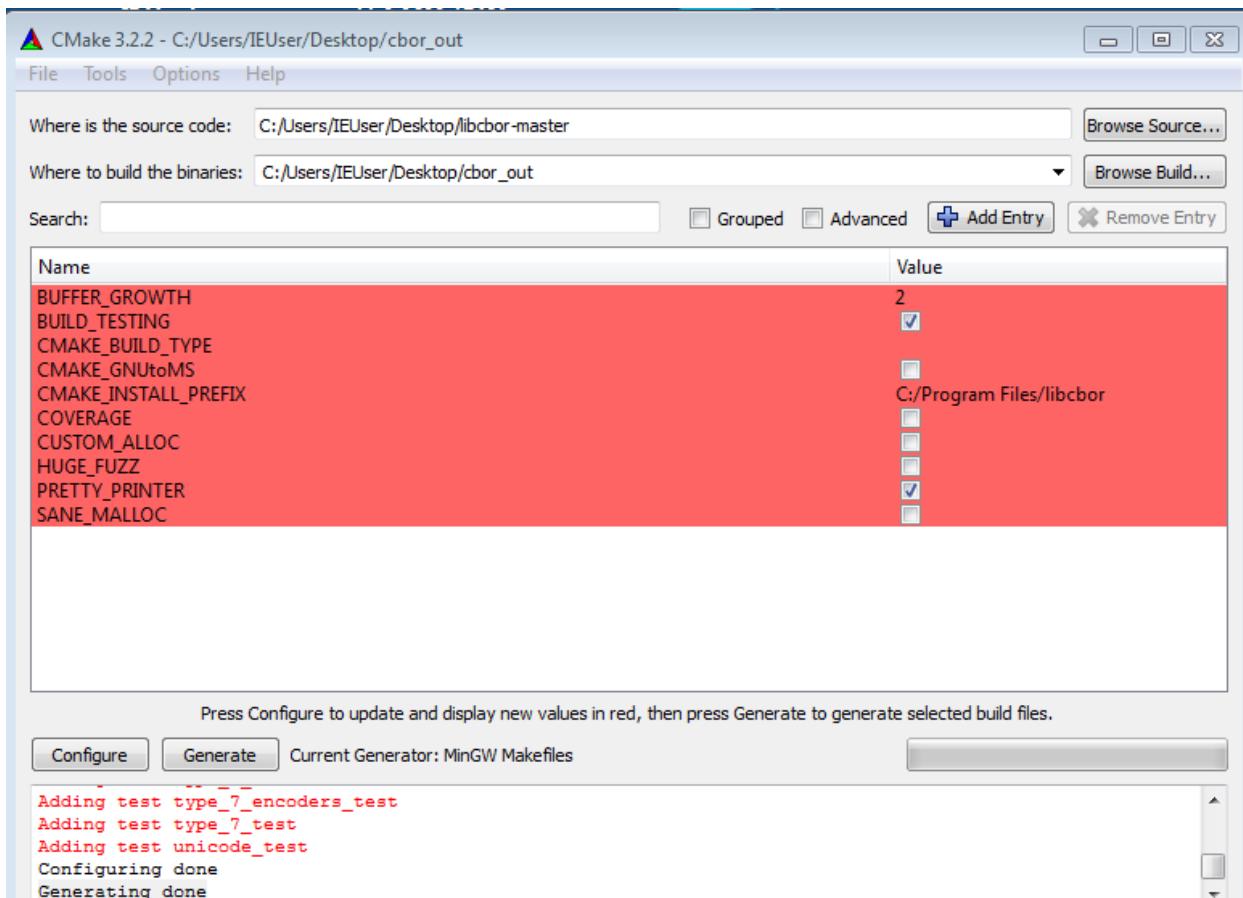

Choose MinGW and confirm.

---

**Note:** If you select Visual Studio at this point, a MSVC project will be generated for you. This is useful if you just want to browse through the source code.

---

You can then adjust the build options. The defaults will work just fine. Hit ‘Generate’ when you are done.

You can then adjust the build options. The defaults will work just fine. Hit ‘Generate’ when you are done.

Open the shell, navigate to the output directory, and run `mingw32-make cbor`.

```

C:\ Command Prompt
Microsoft Windows [Version 6.1.7601]
Copyright <c> 2009 Microsoft Corporation. All rights reserved.

C:\Users\IEUser>cd Desktop\cbor_out
C:\Users\IEUser\Desktop\cbor_out>mingw32-make cbor_

```

*libcbor* will be built and your .dll should be ready at this point

```
C:\Users\IEUser\Desktop\cbor_out>mingw32-make cbor

[CBOR_TYPE_UINT] Width: 1B, Value: 4

C:\Users\IEUser\Desktop\cbor_out>
```

## 2.1.4 Troubleshooting

**cbor.h not found:** The headers directory is probably not in your include path. First, verify the installation location by checking the install log. If you used make, it will look something like

```
...
-- Installing: /usr/local/include/cbor
-- Installing: /usr/local/include/cbor/callbacks.h
-- Installing: /usr/local/include/cbor/encoding.h
...
```

Make sure that `CMAKE_INSTALL_PREFIX` (if you provided it) was correct. Including the path during compi-

lation should suffice, e.g.:

```
cc -I/usr/local/include hello_cbor.c -lcbor -o hello_cbor
```

**cannot find -lcbor during linking:** Most likely the same problem as before. Include the installation directory in the linker shared path using `-R`, e.g.:

```
cc -Wl,-rpath,/usr/local/lib -lcbor -o hello_cbor
```

**shared library missing during execution:** Verify the linkage using `ldd`, `otool`, or similar and adjust the compilation directives accordingly:

```
ldd hello_cbor
 linux-vdso.so.1 => (0x00007ffe85585000)
 libcbor.so => /usr/local/lib/libcbor.so (0x00007f9af69da000)
 libc.so.6 => /lib/x86_64-linux-gnu/libc.so.6 (0x00007f9af65eb000)
 /lib64/ld-linux-x86-64.so.2 (0x00007f9af6be9000)
```

**compilation failed:** If your compiler supports C99 yet the compilation has failed, please report the issue to the [issue tracker](#).

## 2.2 Usage & preliminaries

### 2.2.1 Version information

libcbor exports its version using three self-explanatory macros:

- CBOR\_MAJOR\_VERSION
- CBOR\_MINOR\_VERSION
- CBOR\_PATCH\_VERSION

The CBOR\_VERSION is a string concatenating these three identifiers into one (e.g. 0.2.0).

In order to simplify version comparisons, the version is also exported as

```
#define CBOR_HEX_VERSION ((CBOR_MAJOR_VERSION << 16) | (CBOR_MINOR_VERSION << 8) | CBOR_PATCH_VERSION)
```

Since macros are difficult to work with through FFIs, the same information is also available through three `uint8_t` constants, namely

- cbor\_major\_version
- cbor\_minor\_version
- cbor\_patch\_version

### 2.2.2 Headers to include

The `cbor.h` header includes all the symbols. If, for any reason, you don't want to include all the exported symbols, feel free to use just some of the `cbor/*.h` headers:

- `cbor/arrays.h` - Type 4 – Arrays
- `cbor/bytestrings.h` - Type 2 – Byte strings
- `cbor/callbacks.h` - Callbacks used for Decoding
- `cbor/common.h` - Common utilities - always transitively included

- `cbor/data.h` - Data types definitions - always transitively included
- `cbor/encoding.h` - Streaming encoders for Encoding
- `cbor/floats_ctrls.h` - Type 7 – Floats & control tokens
- `cbor/ints.h` - Types 0 & 1 – Positive and negative integers
- `cbor/maps.h` - Type 5 – Maps
- `cbor/serialization.h` - High level serialization such as `cbor_serialize()`
- `cbor/streaming.h` - Home of `cbor_stream_decode()`
- `cbor/strings.h` - Type 3 – UTF-8 strings
- `cbor/tags.h` - Type 6 – Semantic tags

### 2.2.3 Using libcbor

If you want to get more familiar with CBOR, we recommend the [cbor.io](http://cbor.io) website. Once you get the grasp of what is it CBOR does, the examples (located in the `examples` directory) should give you a good feel of the API. The [API documentation](#) should then provide with all the information you may need.

#### Creating and serializing items

```
#include "cbor.h"
#include <stdio.h>

int main(int argc, char * argv[])
{
    /* Preallocate the map structure */
    cbor_item_t * root = cbor_new_definite_map(2);
    /* Add the content */
    cbor_map_add(root, (struct cbor_pair) {
        .key = cbor_move(cbor_build_string("Is CBOR awesome?")),
        .value = cbor_move(cbor_build_bool(true))
    });
    cbor_map_add(root, (struct cbor_pair) {
        .key = cbor_move(cbor_build_uint8(42)),
        .value = cbor_move(cbor_build_string("Is the answer"))
    });
    /* Output: `length` bytes of data in the `buffer` */
    unsigned char * buffer;
    size_t buffer_size, length = cbor_serialize_alloc(root, &buffer, &buffer_size);

    fwrite(buffer, 1, length, stdout);
    free(buffer);

    fflush(stdout);
    cbor_decref(&root);
}
```

#### Reading serialized data

```
#include "cbor.h"
#include <stdio.h>

/*
 * Reads data from a file. Example usage:
 * $ ./examples/readfile examples/data/nested_array.cbor
```

```
/*
int main(int argc, char * argv[])
{
    FILE * f = fopen(argv[1], "rb");
    fseek(f, 0, SEEK_END);
    size_t length = (size_t)ftell(f);
    fseek(f, 0, SEEK_SET);
    unsigned char * buffer = malloc(length);
    fread(buffer, length, 1, f);

    /* Assuming `buffer` contains `info.st_size` bytes of input data */
    struct cbor_load_result result;
    cbor_item_t * item = cbor_load(buffer, length, &result);
    /* Pretty-print the result */
    cbor_describe(item, stdout);
    fflush(stdout);
    /* Deallocate the result */
    cbor_decref(&item);

    fclose(f);
}
```

## Using the streaming parser

```
#include "cbor.h"
#include <stdio.h>
#include <string.h>

/*
 * Illustrates how one might skim through a map (which is assumed to have
 * string keys and values only), looking for the value of a specific key
 *
 * Use the examples/data/map.cbor input to test this.
 */

const char * key = "a secret key";
bool key_found = false;

void find_string(void * _ctx, cbor_data buffer, size_t len)
{
    if (key_found) {
        printf("Found the value: %*s\n", (int) len, buffer);
        key_found = false;
    } else if (len == strlen(key)) {
        key_found = (memcmp(key, buffer, len) == 0);
    }
}

int main(int argc, char * argv[])
{
    FILE * f = fopen(argv[1], "rb");
    fseek(f, 0, SEEK_END);
    size_t length = (size_t)ftell(f);
    fseek(f, 0, SEEK_SET);
    unsigned char * buffer = malloc(length);
    fread(buffer, length, 1, f);

    struct cbor_callbacks callbacks = cbor_empty_callbacks;
```

```
struct cbor_decoder_result decode_result;
size_t bytes_read = 0;
callbacks.string = find_string;
while (bytes_read < length) {
    decode_result = cbor_stream_decode(buffer + bytes_read,
                                       length - bytes_read,
                                       &callbacks, NULL);
    bytes_read += decode_result.read;
}

fclose(f);
}
```

## 2.3 API

The data API is centered around `cbor_item_t`, a generic handle for any CBOR item. There are functions to

- create items,
- set items' data,
- parse serialized data into items,
- manage, move, and links item together.

The single most important thing to keep in mind is: **`cbor_item_t` is an opaque type and should only be manipulated using the appropriate functions!** Think of it as an object.

The *libcbor* API closely follows the semantics outlined by [CBOR standard](#). This part of the documentation provides a short overview of the CBOR constructs, as well as a general introduction to the *libcbor* API. Remaining reference can be found in the following files structured by data types.

The API is designed to allow both very tight control & flexibility and general convenience with sane defaults.<sup>1</sup> For example, client with very specific requirements (constrained environment, custom application protocol built on top of CBOR, etc.) may choose to take full control (and responsibility) of memory and data structures management by interacting directly with the decoder. Other clients might want to take control of specific aspects (streamed collections, hash maps storage), but leave other responsibilities to *libcbor*. More general clients might prefer to be abstracted away from all aforementioned details and only be presented complete data structures.

### *libcbor* provides

- stateless encoders and decoders
- encoding and decoding *drivers*, routines that coordinate encoding and decoding of complex structures
- data structures to represent and transform CBOR structures
- routines for building and manipulating these structures
- utilities for inspection and debugging

### 2.3.1 Types of items

Every `cbor_item_t` has a `cbor_type` associated with it - these constants correspond to the types specified by the CBOR standard:

---

<sup>1</sup> <http://softwareengineering.vazexqi.com/files/pattern.html>

**enum cbor\_type**

Specifies the Major type of `cbor_item_t`.

*Values:*

**CBOR\_TYPE\_UINT**

0 - positive integers

**CBOR\_TYPE\_NEGINT**

1 - negative integers

**CBOR\_TYPE\_BYTESTRING**

2 - byte strings

**CBOR\_TYPE\_STRING**

3 - strings

**CBOR\_TYPE\_ARRAY**

4 - arrays

**CBOR\_TYPE\_MAP**

5 - maps

**CBOR\_TYPE\_TAG**

6 - tags

**CBOR\_TYPE\_FLOAT\_CTRL**

7 - decimals and special values (true, false, nil, ...)

To find out the type of an item, one can use

`cbor_type cbor_typeof (const cbor_item_t *item)`

Get the type of the item.

**Return**

The type

**Parameters**

- `item[borrow]` -

Please note the distinction between functions like `cbor_isa_uint ()` and `cbor_is_int ()`. The following functions work solely with the major type value.

**Binary queries**

Alternatively, there are functions to query each particular type.

**Warning:** Passing an invalid `cbor_item_t` reference to any of these functions results in undefined behavior.

`bool cbor_isa_uint (const cbor_item_t *item)`

Does the item have the appropriate major type?

**Return**

Is the item an `CBOR_TYPE_UINT`?

**Parameters**

- `item[borrow]` - the item

`bool cbor_isa_negint (const cbor_item_t *item)`  
Does the item have the appropriate major type?

**Return**

Is the item a *CBOR\_TYPE\_NEGINT*?

**Parameters**

- `item[borrow]` - the item

`bool cbor_isa_bytestring (const cbor_item_t *item)`  
Does the item have the appropriate major type?

**Return**

Is the item a *CBOR\_TYPE\_BYTESTRING*?

**Parameters**

- `item[borrow]` - the item

`bool cbor_isa_string (const cbor_item_t *item)`  
Does the item have the appropriate major type?

**Return**

Is the item a *CBOR\_TYPE\_STRING*?

**Parameters**

- `item[borrow]` - the item

`bool cbor_isa_array (const cbor_item_t *item)`  
Does the item have the appropriate major type?

**Return**

Is the item an *CBOR\_TYPE\_ARRAY*?

**Parameters**

- `item[borrow]` - the item

`bool cbor_isa_map (const cbor_item_t *item)`  
Does the item have the appropriate major type?

**Return**

Is the item a *CBOR\_TYPE\_MAP*?

**Parameters**

- `item[borrow]` - the item

`bool cbor_isa_tag (const cbor_item_t *item)`  
Does the item have the appropriate major type?

**Return**

Is the item a *CBOR\_TYPE\_TAG*?

**Parameters**

- `item[borrow]` - the item

`bool cbor_is_a_float_ctrl (const cbor_item_t *item)`

Does the item have the appropriate major type?

**Return**

Is the item a `CBOR_TYPE_FLOAT_CTRL`?

**Parameters**

- `item[borrow]` - the item

**Logical queries**

These functions provide information about the item type from a more high-level perspective

`bool cbor_is_int (const cbor_item_t *item)`

Is the item an integer, either positive or negative?

**Return**

Is the item an integer, either positive or negative?

**Parameters**

- `item[borrow]` - the item

`bool cbor_is_float (const cbor_item_t *item)`

Is the item an a floating point number?

**Return**

Is the item a floating point number?

**Parameters**

- `item[borrow]` - the item

`bool cbor_is_bool (const cbor_item_t *item)`

Is the item an a boolean?

**Return**

Is the item a boolean?

**Parameters**

- `item[borrow]` - the item

`bool cbor_is_null (const cbor_item_t *item)`

Does this item represent null

**Warning:** This is in no way related to the value of the pointer. Passing a null pointer will most likely result in a crash.

**Return**

Is the item (CBOR logical) null?

**Parameters**

- item[borrow] - the item

bool **cbor\_is\_undef** (const *cbor\_item\_t* \*item)

Does this item represent undefined

**Warning:** Care must be taken to distinguish nulls and undefined values in C.

**Return**

Is the item (CBOR logical) undefined?

**Parameters**

- item[borrow] - the item

## 2.3.2 Memory management and reference counting

Due to the nature of its domain *libcbor* will need to work with heap memory. The stateless decoder and encoder don't allocate any memory.

If you have specific requirements, you should consider rolling your own driver for the stateless API.

### Using custom allocator

*libcbor* gives you with the ability to provide your own implementations of malloc, realloc, and free. This can be useful if you are using a custom allocator throughout your application, or if you want to implement custom policies (e.g. tighter restrictions on the amount of allocated memory).

In order to use this feature, *libcbor* has to be compiled with the appropriate flags. You can verify the configuration using the CBOR\_CUSTOM\_ALLOC macro. A simple usage might be as follows:

```
#ifdef CBOR_CUSTOM_ALLOC
    cbor_set_allocs(malloc, realloc, free);
#else
    #error "libcbor built with support for custom allocation is required"
#endif
```

void **cbor\_set\_allocs** (\_cbor\_malloc\_t *custom\_malloc*, \_cbor\_realloc\_t *custom\_realloc*, \_cbor\_free\_t  
                  *custom\_free*)

Sets the memory management routines to use.

Only available when CBOR\_CUSTOM\_ALLOC is defined

**Warning:** This function modifies the global state and should therefore be used accordingly. Changing the memory handlers while allocated items exist will result in a free/malloc mismatch. This function is not thread safe with respect to both itself and all the other *libcbor* functions that work with the heap.

---

**Note:** *realloc* implementation must correctly support *NULL* reallocation

---

**Parameters**

- *custom\_malloc* - malloc implementation
- *custom\_realloc* - realloc implementation
- *custom\_free* - free implementation

## Reference counting

As CBOR items may require complex cleanups at the end of their lifetime, there is a reference counting mechanism in place. This also enables very simple GC when integrating *libcbor* into managed environment. Every item starts its life (by either explicit creation, or as a result of parsing) with reference count set to 1. When the refcount reaches zero, it will be destroyed.

Items containing nested items will be destroyed recursively - refcount of every nested item will be decreased by one.

The destruction is synchronous and renders any pointers to items with refcount zero invalid immediately after calling the `cbor_decref()`.

`cbor_item_t *cbor_incref(cbor_item_t *item)`

Increases the reference count by one.

No dependent items are affected.

### Return

the input reference

### Parameters

- `item[incref]` - item the item

`void cbor_decref(cbor_item_t **item)`

Decreases the reference count by one, deallocating the item if needed.

In case the item is deallocated, the reference count of any dependent items is adjusted accordingly in a recursive manner.

### Parameters

- `item[take]` - the item. Set to NULL if deallocated

`void cbor_intermediate_decref(cbor_item_t *item)`

Decreases the reference count by one, deallocating the item if needed.

Convenience wrapper for `cbor_decref` when its set-to-null behavior is not needed

### Parameters

- `item[take]` - the item

`size_t cbor_refcount(const cbor_item_t *item)`

Get the reference count.

**Warning:** This does *not* account for transitive references.

### Return

the reference count

### Parameters

- `item[borrow]` - the item

`cbor_item_t *cbor_move (cbor_item_t *item)`

Provide CPP-like move construct.

Decreases the reference count by one, but does not deallocate the item even if it reaches zero. This is useful for passing intermediate values to functions that increase reference count. Should only be used with functions that `inref` their arguments.

**Warning:** If the item is moved without correctly increasing the reference count afterwards, the memory will be leaked.

## Return

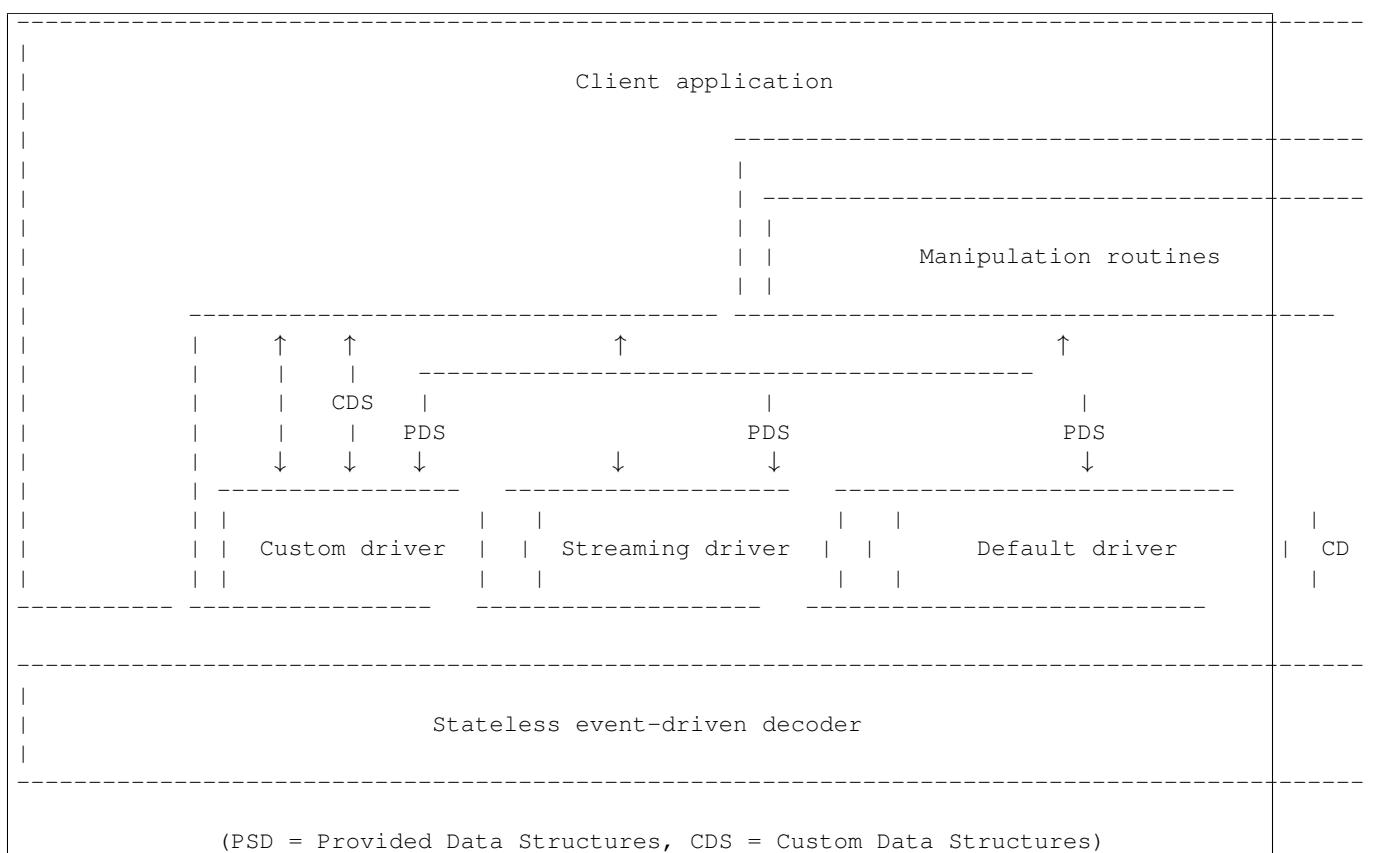

the item with reference count decreased by one

## Parameters

- `item[take]` - the item

### 2.3.3 Decoding

The following diagram illustrates the relationship among different parts of libcbor from the decoding standpoint.

This section will deal with the API that is labeled as the “Default driver” in the diagram. That is, routines that decode complete libcbor data items

`cbor_item_t *cbor_load (cbor_data_source source, size_t source_size, struct cbor_load_result *result)`

Loads data item from a buffer.

## Return

**new** CBOR item or `NULL` on failure. In that case, `result` contains location and description of the error.

### Parameters

- `source` - The buffer
- `source_size` -
- `result [out]` - Result indicator. `CBOR_ERR_NONE` on success

### Associated data structures

#### `enum cbor_error_code`

Possible decoding errors.

*Values:*

`CBOR_ERR_NONE`

`CBOR_ERR_NOTENOUGHDATA`

`CBOR_ERR_NODATA`

`CBOR_ERR_MALFORMATED`

`CBOR_ERR_MEMERROR`

Memory error - item allocation failed.

Is it too big for your allocator?

`CBOR_ERR_SYNTAXERROR`

Stack parsing algorithm failed.

#### `struct cbor_load_result`

High-level decoding result.

### Public Members

#### `struct cbor_error_error`

Error indicator.

#### `size_t read`

Number of bytes read.

#### `struct cbor_error`

High-level decoding error.

### Public Members

#### `size_t position`

Aproximate position.

#### `cbor_error_code code`

Description.

## 2.3.4 Encoding

The easiest way to encode data items is using the `cbor_serialize()` or `cbor_serialize_alloc()` functions:

`size_t cbor_serialize(const cbor_item_t *item, cbor_mutable_data buffer, size_t buffer_size)`  
Serialize the given item.

### Return

Length of the result. 0 on failure.

### Parameters

- `item[borrow]` - A data item
- `buffer` - Buffer to serialize to
- `buffer_size` - Size of the buffer

`size_t cbor_serialize_alloc(const cbor_item_t *item, cbor_mutable_data *buffer, size_t *buffer_size)`  
Serialize the given item, allocating buffers as needed.

**Warning:** It is your responsibility to free the buffer using an appropriate `free` implementation.

### Return

Length of the result. 0 on failure, in which case `buffer` is `NULL`.

### Parameters

- `item[borrow]` - A data item
- `buffer[out]` - Buffer containing the result
- `buffer_size[out]` - Size of the buffer

## Type-specific serializers

In case you know the type of the item you want to serialize beforehand, you can use one of the type-specific serializers.

---

**Note:** Unless compiled in debug mode, these do not verify the type. Passing an incorrect item will result in an undefined behavior.

---

`size_t cbor_serialize_uint(const cbor_item_t *, cbor_mutable_data, size_t)`  
Serialize an uint.

### Return

Length of the result. 0 on failure.

### Parameters

- `item[borrow]` - A uint
- `buffer` - Buffer to serialize to
- `buffer_size` - Size of the buffer

---

```
size_t cbor_serialize_negint(const cbor_item_t *, cbor_mutable_data, size_t)
```

Serialize a negint.

**Return**

Length of the result. 0 on failure.

**Parameters**

- item[borrow] - A negint
- buffer - Buffer to serialize to
- buffer\_size - Size of the buffer

```
size_t cbor_serialize_bytestring(const cbor_item_t *, cbor_mutable_data, size_t)
```

Serialize a bytestring.

**Return**

Length of the result. 0 on failure.

**Parameters**

- item[borrow] - A bytestring
- buffer - Buffer to serialize to
- buffer\_size - Size of the buffer

```
size_t cbor_serialize_string(const cbor_item_t *, cbor_mutable_data, size_t)
```

Serialize a string.

**Return**

Length of the result. 0 on failure.

**Parameters**

- item[borrow] - A string
- buffer - Buffer to serialize to
- buffer\_size - Size of the buffer

```
size_t cbor_serialize_array(const cbor_item_t *, cbor_mutable_data, size_t)
```

Serialize an array.

**Return**

Length of the result. 0 on failure.

**Parameters**

- item[borrow] - An array
- buffer - Buffer to serialize to
- buffer\_size - Size of the buffer

```
size_t cbor_serialize_map(const cbor_item_t *, cbor_mutable_data, size_t)
```

Serialize a map.

### Return

Length of the result. 0 on failure.

### Parameters

- item[borrow] - A map
- buffer - Buffer to serialize to
- buffer\_size - Size of the buffer

size\_t **cbor\_serialize\_tag**(const *cbor\_item\_t* \*, cbor\_mutable\_data, size\_t)  
Serialize a tag.

### Return

Length of the result. 0 on failure.

### Parameters

- item[borrow] - A tag
- buffer - Buffer to serialize to
- buffer\_size - Size of the buffer

size\_t **cbor\_serialize\_float\_ctrl**(const *cbor\_item\_t* \*, cbor\_mutable\_data, size\_t)  
Serialize a.

### Return

Length of the result. 0 on failure.

### Parameters

- item[borrow] - A float or ctrl
- buffer - Buffer to serialize to
- buffer\_size - Size of the buffer

## 2.3.5 Types 0 & 1 – Positive and negative integers

*CBOR* has two types of integers – positive (which may be effectively regarded as unsigned), and negative. There are four possible widths for an integer – 1, 2, 4, or 8 bytes. These are represented by

**enum cbor\_int\_width**

Possible widths of *CBOR\_TYPE\_UINT* items.

*Values:*

**CBOR\_INT\_8**

**CBOR\_INT\_16**

**CBOR\_INT\_32**

**CBOR\_INT\_64**

## Type 0 - positive integers

Corresponding <code>cbor_type</code>	<code>CBOR_TYPE_UINT</code>
Number of allocations	One per lifetime
Storage requirements	<code>sizeof(cbor_item_t) + sizeof(uint*_t)</code>

**Note:** once a positive integer has been created, its width *cannot* be changed.

## Type 1 - negative integers

Corresponding <code>cbor_type</code>	<code>CBOR_TYPE_NEGINT</code>
Number of allocations	One per lifetime
Storage requirements	<code>sizeof(cbor_item_t) + sizeof(uint*_t)</code>

**Note:** once a positive integer has been created, its width *cannot* be changed.

## Type 0 & 1

Due to their largely similar semantics, the following functions can be used for both Type 0 and Type 1 items. One can convert between them freely using [the conversion functions](#).

Actual Type of the integer can be checked using item types API.

An integer item is created with one of the four widths. Because integers' storage is bundled together with the handle, the width cannot be changed over its lifetime.

**Warning:** Due to the fact that CBOR negative integers represent integers in the range  $[-1, -2^N]$ , `cbor_set_uint` API is somewhat counter-intuitive as the resulting logical value is 1 less. This behavior is necessary in order to permit uniform manipulation with the full range of permitted values. For example, the following snippet

```
cbor_item_t * item = cbor_new_int8();
cbor_mark_negint(item);
cbor_set_uint8(0);
```

will produce an item with the logical value of  $-1$ . There is, however, an upside to this as well: There is only one representation of zero.

## Building new items

`cbor_item_t *cbor_build_uint8(uint8_t value)`  
Constructs a new positive integer.

### Return

`new` positive integer

### Parameters

- `value` - the value to use

`cbor_item_t *cbor_build_uint16(uint16_t value)`  
Constructs a new positive integer.

**Return**

new positive integer

**Parameters**

- value - the value to use

*cbor\_item\_t \*cbor\_build\_uint32 (uint32\_t value)*

Constructs a new positive integer.

**Return**

new positive integer

**Parameters**

- value - the value to use

*cbor\_item\_t \*cbor\_build\_uint64 (uint64\_t value)*

Constructs a new positive integer.

**Return**

new positive integer

**Parameters**

- value - the value to use

## Retrieving values

*uint8\_t cbor\_get\_uint8 (const cbor\_item\_t \*item)*

Extracts the integer value.

**Return**

the value

**Parameters**

- item[borrow] - positive or negative integer

*uint16\_t cbor\_get\_uint16 (const cbor\_item\_t \*item)*

Extracts the integer value.

**Return**

the value

**Parameters**

- item[borrow] - positive or negative integer

*uint32\_t cbor\_get\_uint32 (const cbor\_item\_t \*item)*

Extracts the integer value.

**Return**

the value

**Parameters**

- item[borrow] - positive or negative integer

`uint64_t cbor_get_uint64 (const cbor_item_t *item)`

Extracts the integer value.

#### Return

the value

#### Parameters

- item[borrow] - positive or negative integer

### Setting values

`void cbor_set_uint8 (cbor_item_t *item, uint8_t value)`

Assigns the integer value.

#### Parameters

- item[borrow] - positive or negative integer item
- value - the value to assign. For negative integer, the logical value is  $-value - 1$

`void cbor_set_uint16 (cbor_item_t *item, uint16_t value)`

Assigns the integer value.

#### Parameters

- item[borrow] - positive or negative integer item
- value - the value to assign. For negative integer, the logical value is  $-value - 1$

`void cbor_set_uint32 (cbor_item_t *item, uint32_t value)`

Assigns the integer value.

#### Parameters

- item[borrow] - positive or negative integer item
- value - the value to assign. For negative integer, the logical value is  $-value - 1$

`void cbor_set_uint64 (cbor_item_t *item, uint64_t value)`

Assigns the integer value.

#### Parameters

- item[borrow] - positive or negative integer item
- value - the value to assign. For negative integer, the logical value is  $-value - 1$

### Dealing with width

`cbor_int_width cbor_int_get_width (const cbor_item_t *item)`

Queries the integer width.

#### Return

the width

### Parameters

- item[borrow] - positive or negative integer item

## Dealing with signedness

void **cbor\_mark\_uint** (*cbor\_item\_t* \*item)

Marks the integer item as a positive integer.

The data value is not changed

### Parameters

- item[borrow] - positive or negative integer item

void **cbor\_mark\_negint** (*cbor\_item\_t* \*item)

Marks the integer item as a negative integer.

The data value is not changed

### Parameters

- item[borrow] - positive or negative integer item

## Creating new items

*cbor\_item\_t* \***cbor\_new\_int8** ()

Allocates new integer with 1B width.

The width cannot be changed once allocated

### Return

**new** positive integer. The value is not initialized.

*cbor\_item\_t* \***cbor\_new\_int16** ()

Allocates new integer with 2B width.

The width cannot be changed once allocated

### Return

**new** positive integer. The value is not initialized.

*cbor\_item\_t* \***cbor\_new\_int32** ()

Allocates new integer with 4B width.

The width cannot be changed once allocated

### Return

**new** positive integer. The value is not initialized.

*cbor\_item\_t* \***cbor\_new\_int64** ()

Allocates new integer with 8B width.

The width cannot be changed once allocated

**Return**

**new** positive integer. The value is not initialized.

### 2.3.6 Type 2 – Byte strings

CBOR byte strings are just (ordered) series of bytes without further interpretation (unless there is a [tag](#)). Byte string's length may or may not be known during encoding. These two kinds of byte strings can be distinguished using `cbor_bytestring_is_definite()` and `cbor_bytestring_is_indefinite()` respectively.

In case a byte string is indefinite, it is encoded as a series of definite byte strings. These are called “chunks”. For example, the encoded item

0xf5	Start indefinite byte string
0x41	Byte string (1B long)
0x00	
0x41	Byte string (1B long)
0xff	
0xff	“Break” control token

represents two bytes, 0x00 and 0xff. This on one hand enables streaming messages even before they are fully generated, but on the other hand it adds more complexity to the client code.

Corresponding <code>cbor_type</code>	CBOR_TYPE_BYTESTRING
Number of allocations (definite)	One plus any manipulations with the data
Number of allocations (indefinite)	One plus logarithmically many reallocations relative to chunk count
Storage requirements (definite)	<code>sizeof(cbor_item_t) + length(handle)</code>
Storage requirements (indefinite)	<code>sizeof(cbor_item_t) * (1 + chunk_count) + chunks</code>

### Streaming indefinite byte strings

Please refer to [Streaming & indefinite items](#).

### Getting metadata

`size_t cbor_bytestring_length(const cbor_item_t *item)`

Returns the length of the binary data.

For definite byte strings only

**Return**

length of the binary data. Zero if no chunk has been attached yet

#### Parameters

- `item[borrow]` - a definite bytestring

`bool cbor_bytestring_is_definite(const cbor_item_t *item)`

Is the byte string definite?

**Return**

Is the byte string definite?

#### Parameters

- `item[borrow]` - a byte string

`bool cbor_bytestring_is_indefinite(const cbor_item_t *item)`

Is the byte string indefinite?

#### Return

Is the byte string indefinite?

#### Parameters

- `item[borrow]` - a byte string

`size_t cbor_bytestring_chunk_count(const cbor_item_t *item)`

Get the number of chunks this string consist of.

#### Return

The chunk count. 0 for freshly created items.

#### Parameters

- `item[borrow]` - A indefinite bytestring

## Reading data

`cbor_mutable_data cbor_bytestring_handle(const cbor_item_t *item)`

Get the handle to the binary data.

Definite items only. Modifying the data is allowed. In that case, the caller takes responsibility for the effect on items this item might be a part of

#### Return

The address of the binary data. `NULL` if no data have been assigned yet.

#### Parameters

- `item[borrow]` - A definite byte string

`cbor_item_t **cbor_bytestring_chunks_handle(const cbor_item_t *item)`

Get the handle to the array of chunks.

Manipulations with the memory block (e.g. sorting it) are allowed, but the validity and the number of chunks must be retained.

#### Return

array of `cbor_bytestring_chunk_count` definite bytestrings

#### Parameters

- `item[borrow]` - A indefinite byte string

## Creating new items

`cbor_item_t *cbor_new_definite_bytestring()`

Creates a new definite byte string.

The handle is initialized to `NULL` and length to 0

**Return**

**new** definite bytestring. NULL on malloc failure.

`cbor_item_t *cbor_new_indefinite_bytestring()`

Creates a new indefinite byte string.

The chunks array is initialized to NULL and chunkcount to 0

**Return**

**new** indefinite bytestring. NULL on malloc failure.

**Building items**

`cbor_item_t *cbor_build_bytestring(cbor_data handle, size_t length)`

Creates a new byte string and initializes it.

The handle will be copied to a newly allocated block

**Return**

A **new** byte string with content handle. NULL on malloc failure.

**Parameters**

- handle - Block of binary data
- length - Length of data

**Manipulating existing items**

`void cbor_bytestring_set_handle(cbor_item_t * item, cbor_mutable_data restrict data, size_t length)`  
Set the handle to the binary data.

**Parameters**

- item[borrow] - A definite byte string
- data - The memory block. The caller gives up the ownership of the block. libcbor will deallocate it when appropriate using its free function
- length - Length of the data block

`bool cbor_bytestring_add_chunk(cbor_item_t *item, cbor_item_t *chunk)`

Appends a chunk to the bytestring.

Indefinite byte strings only.

May realloc the chunk storage.

**Return**

true on success, false on realloc failure. In that case, the refcount of chunk is not increased and the item is left intact.

**Parameters**

- item[borrow] - An indefinite byte string
- item[incref] - A definite byte string

## 2.3.7 Type 3 – UTF-8 strings

CBOR strings work in much the same ways as [Type 2 – Byte strings](#).

Corresponding <code>cbor_type</code>	<code>CBOR_TYPE_STRING</code>
Number of allocations (definite)	One plus any manipulations with the data
Number of allocations (indefinite)	One plus logarithmically many reallocations relative to chunk count
Storage requirements (definite)	<code>sizeof(cbor_item_t) + length(handle)</code>
Storage requirements (indefinite)	<code>sizeof(cbor_item_t) * (1 + chunk_count) + chunks</code>

### Streaming indefinite strings

Please refer to [Streaming & indefinite items](#).

### UTF-8 encoding validation

*libcbor* considers UTF-8 encoding validity to be a part of the well-formedness notion of CBOR and therefore invalid UTF-8 strings will be rejected by the parser. Strings created by the user are not checked.

### Getting metadata

`size_t cbor_string_length(const cbor_item_t *item)`

Returns the length of the underlying string.

For definite strings only

#### Return

length of the string. Zero if no chunk has been attached yet

#### Parameters

- `item[borrow]` - a definite string

`bool cbor_string_is_definite(const cbor_item_t *item)`

Is the string definite?

#### Return

Is the string definite?

#### Parameters

- `item[borrow]` - a string

`bool cbor_string_is_indefinite(const cbor_item_t *item)`

Is the string indefinite?

#### Return

Is the string indefinite?

#### Parameters

- `item[borrow]` - a string

---

`size_t cbor_string_chunk_count (const cbor_item_t *item)`  
Get the number of chunks this string consist of.

**Return**

The chunk count. 0 for freshly created items.

**Parameters**

- `item[borrow]` - A indefinite string

**Reading data**

`cbor_mutable_data cbor_string_handle (const cbor_item_t *item)`  
Get the handle to the underlying string.

Definite items only. Modifying the data is allowed. In that case, the caller takes responsibility for the effect on items this item might be a part of

**Return**

The address of the underlying string. `NULL` if no data have been assigned yet.

**Parameters**

- `item[borrow]` - A definite string

`cbor_item_t **cbor_string_chunks_handle (const cbor_item_t *item)`  
Get the handle to the array of chunks.

Manipulations with the memory block (e.g. sorting it) are allowed, but the validity and the number of chunks must be retained.

**Return**

array of `cbor_string_chunk_count` definite strings

**Parameters**

- `item[borrow]` - A indefinite string

**Creating new items**

`cbor_item_t *cbor_new_definite_string ()`  
Creates a new definite string.

The handle is initialized to `NULL` and length to 0

**Return**

`new` definite string. `NULL` on malloc failure.

`cbor_item_t *cbor_new_indefinite_string ()`  
Creates a new indefinite string.

The chunks array is initialized to `NULL` and chunkcount to 0

**Return**

`new` indefinite string. `NULL` on malloc failure.

## Building items

`cbor_item_t *cbor_build_string(const char *val)`

Creates a new string and initializes it.

The `val` will be copied to a newly allocated block

### Return

A **new** string with content handle. NULL on malloc failure.

### Parameters

- `val` - A null-terminated UTF-8 string

## Manipulating existing items

`void cbor_string_set_handle(cbor_item_t * item, cbor_mutable_data restrict data, size_t size)`  
Set the handle to the underlying string.

**Warning:** Using a pointer to a stack allocated constant is a common mistake. Lifetime of the string will expire when it goes out of scope and the CBOR item will be left inconsistent.

### Parameters

- `item[borrow]` - A definite string
- `data` - The memory block. The caller gives up the ownership of the block. libcbor will deallocate it when appropriate using its free function
- `length` - Length of the data block

`bool cbor_string_add_chunk(cbor_item_t *item, cbor_item_t *chunk)`

Appends a chunk to the string.

Indefinite strings only.

May realloc the chunk storage.

### Return

true on success. false on realloc failure. In that case, the refcount of `chunk` is not increased and the `item` is left intact.

### Parameters

- `item[borrow]` - An indefinite string
- `item[incref]` - A definite string

## 2.3.8 Type 4 – Arrays

CBOR arrays, just like `byte strings` and `strings`, can be encoded either as definite, or as indefinite.

Corresponding <i>cbor_type</i>	CBOR_TYPE_ARRAY
Number of allocations (definite)	Two plus any manipulations with the data
Number of allocations (indefinite)	Two plus logarithmically many reallocations relative to additions
Storage requirements (definite)	<code>(sizeof(cbor_item_t) + 1) * size</code>
Storage requirements (indefinite)	<code>&lt;= sizeof(cbor_item_t) + sizeof(cbor_item_t) * size * BUFFER_GROWTH</code>

## Examples

```
0x9f      Start indefinite array
 0x01      Unsigned integer 1
 0xff      "Break" control token
```

```
0x9f      Start array, 1B length follows
0x20      Unsigned integer 32
...
            32 items follow
```

## Streaming indefinite arrays

Please refer to Streaming & indefinite items.

### Getting metadata

`size_t cbor_array_size(const cbor_item_t *item)`  
Get the number of members.

#### Return

The number of members

#### Parameters

- `item[borrow]` - An array

`size_t cbor_array_allocated(const cbor_item_t *item)`  
Get the size of the allocated storage.

#### Return

The size of the allocated storage (number of items)

#### Parameters

- `item[borrow]` - An array

`bool cbor_array_is_definite(const cbor_item_t *item)`  
Is the array definite?

#### Return

Is the array definite?

### Parameters

- `item[borrow]` - An array

`bool cbor_array_is_indefinite (const cbor_item_t *item)`

Is the array indefinite?

### Return

Is the array indefinite?

### Parameters

- `item[borrow]` - An array

## Reading data

`cbor_item_t **cbor_array_handle (const cbor_item_t *item)`

Get the array contents.

The items may be reordered and modified as long as references remain consistent.

### Return

`cbor_array_size` items

### Parameters

- `item[borrow]` - An array

`cbor_item_t *cbor_array_get (const cbor_item_t *item, size_t index)`

Get item by index.

### Return

`inref` The item, or `NULL` in case of boundary violation

### Parameters

- `item[borrow]` - An array
- `index` - The index

## Creating new items

`cbor_item_t *cbor_new_definite_array (const size_t size)`

Create new definite array.

### Return

`new` array or `NULL` upon malloc failure

### Parameters

- `size` - Number of slots to preallocate

`cbor_item_t *cbor_new_indefinite_array ()`

Create new indefinite array.

**Return**

`new` array or `NULL` upon malloc failure

**Modifying items**

`bool cbor_array_push(cbor_item_t *array, cbor_item_t *pushee)`

Append to the end.

For indefinite items, storage may be reallocated. For definite items, only the preallocated capacity is available.

**Return**

true on success, false on failure

**Parameters**

- `array` [borrow] - An array
- `pushee` [inref] - The item to push

`bool cbor_array_replace(cbor_item_t *item, size_t index, cbor_item_t *value)`

Replace item at an index.

The item being replace will be `cbor_DECREF` ‘ed.

**Return**

true on success, false on allocation failure.

**Parameters**

- `item` [borrow] - An array
- `value` [inref] - The item to assign
- `index` - The index

`bool cbor_array_set(cbor_item_t *item, size_t index, cbor_item_t *value)`

Set item by index.

Creating arrays with holes is not possible

**Return**

true on success, false on allocation failure.

**Parameters**

- `item` [borrow] - An array
- `value` [inref] - The item to assign
- `index` - The index

## 2.3.9 Type 5 – Maps

CBOR maps are the plain old associate hash maps known from JSON and many other formats and languages, with one exception: any CBOR data item can be a key, not just strings. This is somewhat unusual and you, as an application developer, should keep that in mind.

Maps can be either definite or indefinite, in much the same way as [Type 4 – Arrays](#).

Corresponding <i>cbor_type</i>	CBOR_TYPE_MAP
Number of allocations (definite)	Two plus any manipulations with the data
Number of allocations (indefinite)	Two plus logarithmically many reallocations relative to additions
Storage requirements (definite)	<code>sizeof(cbor_pair) * size + sizeof(cbor_item_t)</code>
Storage requirements (indefinite)	<code>&lt;= sizeof(cbor_item_t) + sizeof(cbor_pair) * size * BUFFER_GROWTH</code>

## Streaming maps

Please refer to Streaming & indefinite items.

## Getting metadata

`size_t cbor_map_size(const cbor_item_t *item)`

Get the number of pairs.

### Return

The number of pairs

### Parameters

- `item[borrow]` - A map

`size_t cbor_map_allocated(const cbor_item_t *item)`

Get the size of the allocated storage.

### Return

Allocated storage size (as the number of `cbor_pair` items)

### Parameters

- `item[borrow]` - A map

`bool cbor_map_is_definite(const cbor_item_t *item)`

Is this map definite?

### Return

Is this map definite?

### Parameters

- `item[borrow]` - A map

`bool cbor_map_is_indefinite(const cbor_item_t *item)`

Is this map indefinite?

### Return

Is this map indefinite?

### Parameters

- item[borrow] - A map

## Reading data

`struct cbor_pair *cbor_map_handle (const cbor_item_t *item)`

Get the pairs storage.

### Return

Array of `cbor_map_size` pairs. Manipulation is possible as long as references remain valid.

### Parameters

- item[borrow] - A map

## Creating new items

`cbor_item_t *cbor_new_definite_map (const size_t size)`

Create a new definite map.

### Return

`new` definite map. NULL on malloc failure.

### Parameters

- size - The number of slots to preallocate

`cbor_item_t *cbor_new_indefinite_map ()`

Create a new indefinite map.

### Return

`new` definite map. NULL on malloc failure.

### Parameters

- size - The number of slots to preallocate

## Modifying items

`bool cbor_map_add (cbor_item_t *item, struct cbor_pair pair)`

Add a pair to the map.

For definite maps, items can only be added to the preallocated space. For indefinite maps, the storage will be expanded as needed

### Return

`true` on success, `false` if either reallocation failed or the preallcoated storage is full

### Parameters

- item[borrow] - A map
- pair[incref] - The key-value pair to add (incref is member-wise)

### 2.3.10 Type 6 – Semantic tags

Tags are additional metadata that can be used to extend or specialize the meaning or interpretation of the other data items.

For example, one might tag an array of numbers to communicate that it should be interpreted as a vector.

Please consult the official [IANA repository of CBOR tags](#) before inventing new ones.

`cbor_item_t *cbor_new_tag(uint64_t value)`

Create a new tag.

#### Return

`new` tag. Item reference is NULL.

#### Parameters

- `value` - The tag value. Please consult the tag repository

`cbor_item_t *cbor_tag_item(const cbor_item_t *item)`

Get the tagged item.

#### Return

`inref` the tagged item

#### Parameters

- `item[borrow]` - A tag

`uint64_t cbor_tag_value(const cbor_item_t *item)`

Get tag value.

#### Return

The tag value. Please consult the tag repository

#### Parameters

- `item[borrow]` - A tag

`void cbor_tag_set_item(cbor_item_t *item, cbor_item_t *tagged_item)`

Set the tagged item.

#### Parameters

- `item[borrow]` - A tag
- `tagged_item[inref]` - The item to tag

### 2.3.11 Type 7 – Floats & control tokens

This type combines two completely unrelated types of items – floating point numbers and special values such as true, false, null, etc. We refer to these special values as ‘control values’ or ‘ctrls’ for short throughout the code.

Just like integers, they have different possible width (resulting in different value ranges and precisions).

`enum cbor_float_width`

Possible widths of `CBOR_TYPE_FLOAT_CTRL` items.

*Values:*

**CBOR\_FLOAT\_0**

Internal use - ctrl and special values.

**CBOR\_FLOAT\_16**

Half float.

**CBOR\_FLOAT\_32**

Single float.

**CBOR\_FLOAT\_64**

Double.

Corresponding <i>cbor_type</i>	CBOR_TYPE_FLOAT_CTRL
Number of allocations	One per lifetime
Storage requirements	<code>sizeof(cbor_item_t) + 1/4/8</code>

**Getting metadata**

`bool cbor_float_ctrl_is_ctrl(const cbor_item_t *item)`

Is this a ctrl value?

**Return**

Is this a ctrl value?

**Parameters**

- `item[borrow]` - A float or ctrl item

`cbor_float_width cbor_float_get_width(const cbor_item_t *item)`

Get the float width.

**Return**

The width.

**Parameters**

- `item[borrow]` - A float or ctrl item

`bool cbor_ctrl_is_bool(const cbor_item_t *item)`

Is this ctrl item a boolean?

**Return**

Is this ctrl item a boolean?

**Parameters**

- `item[borrow]` - A ctrl item

**Reading data**

`float cbor_float_get_float2(const cbor_item_t *item)`

Get a half precision float.

The item must have the corresponding width

**Return**

half precision value

**Parameters**

- borrow] - A half precision float

float **cbor\_float\_get\_float4** (const *cbor\_item\_t* \**item*)

Get a single precision float.

The item must have the corresponding width

**Return**

single precision value

**Parameters**

- borrow] - A signle precision float

double **cbor\_float\_get\_float8** (const *cbor\_item\_t* \**item*)

Get a double precision float.

The item must have the corresponding width

**Return**

double precision value

**Parameters**

- borrow] - A double precision float

double **cbor\_float\_get\_float** (const *cbor\_item\_t* \**item*)

Get the float value represented as double.

Can be used regardless of the width.

**Return**

double precision value

**Parameters**

- borrow] - Any float

uint8\_t **cbor\_ctrl\_value** (const *cbor\_item\_t* \**item*)

Reads the control value.

**Return**

the simple value

**Parameters**

- item[borrow] - A ctrl item

## Creating new items

`cbor_item_t *cbor_new_ctrl()`

Constructs a new ctrl item.

The width cannot be changed once the item is created

### Return

**new** 1B ctrl

`cbor_item_t *cbor_new_float2()`

Constructs a new float item.

The width cannot be changed once the item is created

### Return

**new** 2B float

`cbor_item_t *cbor_new_float4()`

Constructs a new float item.

The width cannot be changed once the item is created

### Return

**new** 4B float

`cbor_item_t *cbor_new_float8()`

Constructs a new float item.

The width cannot be changed once the item is created

### Return

**new** 8B float

`cbor_item_t *cbor_new_null()`

Constructs new null ctrl item.

### Return

**new** null ctrl item

`cbor_item_t *cbor_new_undef()`

Constructs new under ctrl item.

### Return

**new** under ctrl item

## Building items

`cbor_item_t *cbor_build_bool(bool value)`

Constructs new boolean ctrl item.

### Return

`new boolen ctrl item`

### Parameters

- `value` - The value to use

## Manipulating existing items

`void cbor_set_ctrl (cbor_item_t *item, uint8_t value)`

Assign a control value.

**Warning:** It is possible to produce an invalid CBOR value by assigning a invalid value using this mechanism. Please consult the standard before use.

### Parameters

- `item[borrow]` - A ctrl item
- `value` - The simple value to assign. Please consult the standard for allowed values

`void cbor_set_float2 (cbor_item_t *item, float value)`

Assigns a float value.

### Parameters

- `item[borrow]` - A half precision float
- `value` - The value to assign

`void cbor_set_float4 (cbor_item_t *item, float value)`

Assigns a float value.

### Parameters

- `item[borrow]` - A single precision float
- `value` - The value to assign

`void cbor_set_float8 (cbor_item_t *item, double value)`

Assigns a float value.

### Parameters

- `item[borrow]` - A double precision float
- `value` - The value to assign

## 2.4 Streaming & indefinite items

CBOR [strings](#), [byte strings](#), [arrays](#), and [maps](#) can be encoded as *indefinite*, meaning their length or size is not specified. Instead, they are divided into *chunks* ([strings](#), [byte strings](#)), or explicitly terminated ([arrays](#), [maps](#)).

This is one of the most important (and due to poor implementations, underutilized) features of CBOR. It enables low-overhead streaming just about anywhere without dealing with channels or pub/sub mechanism. It is, however, important to recognize that CBOR streaming is not a substitute for Websockets<sup>2</sup> and similar technologies.

### 2.4.1 Decoding

Another way to decode data using libcbor is to specify a callbacks that will be invoked when upon finding certain items in the input. This service is provided by

```
struct cbor_decoder_result cbor_stream_decode(cbor_data buffer, size_t buffer_size, const struct
                                              cbor_callbacks *callbacks, void *context)
```

Stateless decoder.

Will try parsing the buffer and will invoke the appropriate callback on success. Decodes one item at a time. No memory allocations occur.

#### Parameters

- `buffer` - Input buffer
- `buffer_size` - Length of the buffer
- `callbacks` - The callback bundle
- `context` - An arbitrary pointer to allow for maintaining context.

To get started, you might want to have a look at the simple streaming example:

```
#include "cbor.h"
#include <stdio.h>
#include <string.h>

/*
 * Illustrates how one might skim through a map (which is assumed to have
 * string keys and values only), looking for the value of a specific key
 *
 * Use the examples/data/map.cbor input to test this.
 */

const char * key = "a secret key";
bool key_found = false;

void find_string(void * _ctx, cbor_data buffer, size_t len)
{
    if (key_found) {
        printf("Found the value: %s\n", (int) len, buffer);
        key_found = false;
    } else if (len == strlen(key)) {
        key_found = (memcmp(key, buffer, len) == 0);
    }
}

int main(int argc, char * argv[])
{
    FILE * f = fopen(argv[1], "rb");
    fseek(f, 0, SEEK_END);
    size_t length = (size_t)ftell(f);
```

<sup>2</sup> RFC 6455

```
fseek(f, 0, SEEK_SET);
unsigned char * buffer = malloc(length);
fread(buffer, length, 1, f);

struct cbor_callbacks callbacks = cbor_empty_callbacks;
struct cbor_decoder_result decode_result;
size_t bytes_read = 0;
callbacks.string = find_string;
while (bytes_read < length) {
    decode_result = cbor_stream_decode(buffer + bytes_read,
                                        length - bytes_read,
                                        &callbacks, NULL);
    bytes_read += decode_result.read;
}

free(buffer);
fclose(f);
}
```

The callbacks are defined by

**struct cbor\_callbacks**

Callback bundle passed to the decoder.

#### Public Members

*cbor\_int8\_callback* **uint8**

Unsigned int.

*cbor\_int16\_callback* **uint16**

Unsigned int.

*cbor\_int32\_callback* **uint32**

Unsigned int.

*cbor\_int64\_callback* **uint64**

Unsigned int.

*cbor\_int64\_callback* **negint64**

Negative int.

*cbor\_int32\_callback* **negint32**

Negative int.

*cbor\_int16\_callback* **negint16**

Negative int.

*cbor\_int8\_callback* **negint8**

Negative int.

*cbor\_simple\_callback* **byte\_string\_start**

Definite byte string.

*cbor\_string\_callback* **byte\_string**

Indefinite byte string start.

*cbor\_string\_callback* **string**

Definite string.

---

*cbor\_simple\_callback* **string\_start**  
Indefinite string start.

*cbor\_simple\_callback* **indef\_array\_start**  
Definite array.

*cbor\_collection\_callback* **array\_start**  
Indefinite array.

*cbor\_simple\_callback* **indef\_map\_start**  
Definite map.

*cbor\_collection\_callback* **map\_start**  
Indefinite map.

*cbor\_int64\_callback* **tag**  
Tags.

*cbor\_float\_callback* **float2**  
Half float.

*cbor\_double\_callback* **float8**  
Single float.

*cbor\_float\_callback* **float4**  
Double float.

*cbor\_simple\_callback* **undefined**  
Undef.

*cbor\_simple\_callback* **null**  
Null.

*cbor\_bool\_callback* **boolean**  
Bool.

*cbor\_simple\_callback* **indef\_break**  
Indefinite item break.

When building custom sets of callbacks, feel free to start from

**const struct cbor\_callbacks cbor\_empty\_callbacks**  
Dummy callback bundle - does nothing.

## Related structures

**enum cbor\_decoder\_status**  
Streaming decoder result - status.

*Values:*

- CBOR\_DECODER\_FINISHED**  
OK, finished.
- CBOR\_DECODER\_NEDATA**  
Not enough data - mismatch with MTB.
- CBOR\_DECODER\_EBUFFER**  
Buffer manipulation problem.
- CBOR\_DECODER\_ERROR**  
Malformed or reserved MTB/value.

```
struct cbor_decoder_result
Streaming decoder result.
```

#### Public Members

`size_t read`  
Bytes read.

#### 2.4.2 Encoding

TODO

### 2.5 Tests

#### 2.5.1 Unit tests

There is a comprehensive test suite employing [CMocka](#). You can run all of them using `ctest` in the build directory. Individual tests are themselves runnable. Please refer to [CTest](#) documentation for detailed information on how to specify particular subset of tests.

## 2.5.2 Testing for memory leaks

Every release is tested for memory correctness. You can run these tests by passing the `-T memcheck` flag to `ctest`.  
<sup>3</sup>

## 2.5.3 Code coverage

Every release is inspected using [GCOV/LCOV](#). Platform-independent code should be fully covered by the test suite. Simply run

```
make coverage
```

or alternatively run `lcov` by hand using

```
lcov --capture --directory . --output-file coverage.info
genhtml coverage.info --output-directory out
```

## 2.5.4 Fuzz testing

Every release is tested using a fuzz test. In this test, a huge buffer filled with random data is passed to the decoder. We require that it either succeeds or fail with a sensible error, without leaking any memory. This is intended to simulate real-world situations where data received from the network are CBOR-decoded before any further processing.

## 2.6 RFC conformance

*libcbor* is, generally speaking, very faithful implementation of [RFC 7049](#). There are, however, some limitations imposed by technical constraints.

### 2.6.1 Bytestring length

There is no explicit limitation of indefinite length byte strings.<sup>4</sup> *libcbor* will not handle byte strings with more chunks than the maximum value of `size_t`. On any sane platform, such string would not fit in the memory anyway. It is, however, possible to process arbitrarily long strings and byte strings using the streaming decoder.

### 2.6.2 “Half-precision” IEEE 754 floats

As of C99 and even C11, there is no standard implementation for 2 bytes floats. *libcbor* packs them as a `double`. When encoding, *libcbor* selects the appropriate wire representation based on metadata and the actual value. This applies both to canonical and normal mode.

## 2.7 Internal mechanics

Internal workings of *libcbor* are mostly derived from the specification. The purpose of this document is to describe technical choices made during design & implementation and to explicate the reasoning behind those choices.

<sup>3</sup> Project should be configured with `-DCMAKE_BUILD_TYPE=Debug` to obtain meaningful description of location of the leak. You might also need `--dSYMutil=yes` on OS X.

<sup>4</sup> <http://tools.ietf.org/html/rfc7049#section-2.2.2>

## 2.7.1 Terminology

MTB	Major Type Byte	<a href="http://tools.ietf.org/html/rfc7049#section-2.1">http://tools.ietf.org/html/rfc7049#section-2.1</a>
DST	Dynamically Sized Type	Type whose storage requirements cannot be determined during compilation (originated in the Rust community)

## 2.7.2 Conventions

API symbols start with `cbor_` or `CBOR_` prefix, internal symbols have `_cbor_` or `_CBOR_` prefix.

## 2.7.3 Inspiration & related projects

Most of the API is largely modelled after existing JSON libraries, including

- Jansson
- json-c
- Gnome's JsonGlib

and also borrowing from

- msgpack-c
- Google Protocol Buffers.

## 2.7.4 General notes on the API design

The API design has two main driving principles:

1. Let the client manage the memory as much as possible
2. Behave exactly as specified by the standard

Combining these two principles in practice turns out to be quite difficult. Indefinite-length strings, arrays, and maps require client to handle every fixed-size chunk explicitly in order to

- ensure the client never runs out of memory due to *libcbor*
- use `realloc()` sparsely and predictably<sup>5</sup>
  - provide strong guarantees about its usage (to prevent latency spikes)
  - provide APIs to avoid `realloc()` altogether
- allow proper handling of (streamed) data bigger than available memory

## 2.7.5 Coding style

This code loosely follows the [Linux kernel coding style](#). Tabs are tabs, and they are 4 characters wide.

---

<sup>5</sup> Reasonable handling of DSTs requires reallocation if the API is to remain sane.

## 2.7.6 Memory layout

CBOR is very dynamic in the sense that it contains many data elements of variable length, sometimes even indefinite length. This section describes internal representation of all CBOR data types.

Generally speaking, data items consist of three parts:

- a generic *handle*,
  - the associated metadata,
  - and the actual data

**type cbor\_item\_t**

Represents the item. Used as an opaque type

*cbor\_type* **type**  
Type discriminator

size t refcount

Reference counter. Used by `chor decref()`, `chor incref()`

**union** chor item metadata **metadata**

Union discriminated by `chor_item_t.type`. Contains type-specific metadata.

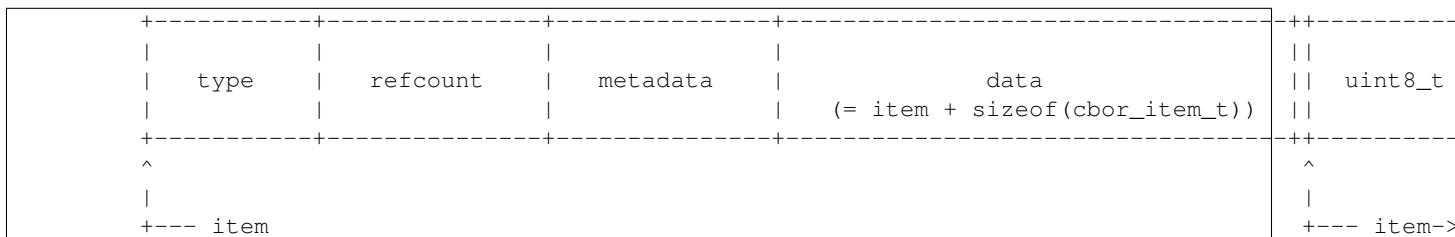

unsigned char \* data

Contains pointer to the actual data. Small, fixed size items (Types 0 & 1 – Positive and negative integers, Type 6 – Semantic tags, Type 7 – Floats & control tokens) are allocated as a single memory block.

Consider the following snippet

```
cbor item_t * item = cbor_new_int8();
```

then the memory is laid out as follows

Dynamically sized types ([Type 2 – Byte strings](#), [Type 3 – UTF-8 strings](#), [Type 4 – Arrays](#), [Type 5 – Maps](#)) may store handle and data in separate locations. This enables creating large items (e.g byte strings) without `realloc()` or copying large blocks of memory. One simply attaches the correct pointer to the handle.

union cbor item metadata

```
struct cbor int metadata int metadata;
```

Used both by both Types 0 & 1 – Positive and negative integers

```
struct cbor bytestring metadata bytestring metadata;
```

```
struct cbor string metadata string metadata;
```

```
struct cbor array metadata array metadata
```

```
struct cbor_map metadata_map metadata;
```

```
struct cbor tag metadata tag metadata;
```

```
struct cbor float ctrl metadata float ctrl metadata;
```

## 2.7.7 Decoding

As outlined in [API](#), there decoding is based on the streaming decoder. Essentially, the decoder is a custom set of callbacks for the streaming decoder.

## 2.8 Changelog

### 2.8.1 Next

### 2.8.2 0.3.0 (2015-05-21)

- Fixes, polishing, niceties across the code base
- Updated examples
- *cbor\_copy*
- *cbor\_build\_negint8*, *16*, *32*, *64*, matching asserts
- *cbor\_build\_string*
- *cbor\_build\_tag*
- *cbor\_build\_float2*, ...

### 2.8.3 0.2.1 (2015-05-17)

- C99 support

### 2.8.4 0.2.0 (2015-05-17)

- *cbor\_ctrl\_bool -> cbor\_ctrl\_is\_bool*
- Added *cbor\_array\_allocated* & map equivalent
- Overhauled endianess conversion - ARM now works as expected
- ‘sort.c’ example added
- Significantly improved and doxyfied documentation

### 2.8.5 0.1.0 (2015-05-06)

The initial release, yay!

## 2.9 Development

### 2.9.1 Development dependencies

- [CMocka](#) (testing)
- Python and [pip](#) (Sphinx platform)

- Doxygen
- Sphinx (documentation)
- There are some Ruby scripts in misc
- Valgrind (memory correctness & profiling)
- GCOV/LCOV (test coverage)

## Building *cmocka*

```
# Starting from libcbor source directory
git submodule update test/cmocka
cd test
mkdir cmocka_build && cd cmocka_build
cmake ../cmocka
make -j 4
make install
```

## Installing *sphinx*

```
pip install sphinx
pip install sphinx_rtd_theme
pip install https://github.com/lepture/python-livereload/archive/master.zip
pip install sphinx-autobuild
```

Further instructions on configuring advanced features can be found at <http://read-the-docs.readthedocs.org/en/latest/install.html>.

## Live preview of docs

```
cd doc
make livehtml
```

## Testing and code coverage

Please refer to Tests
