Documentation for version 0.8.0, updated on Sep 20, 2020.

## **OVERVIEW**

*libcbor* is a C library for parsing and generating **CBOR**, the general-purpose schema-less binary data format.

### **Main features**

- Complete RFC conformance<sup>1</sup>
- Robust C99 implementation
- Layered architecture offers both control and convenience
- Flexible memory management
- No shared global state - threading friendly<sup>2</sup>
- Proper handling of UTF-8
- Full support for streams & incremental processing
- Extensive documentation and test suite
- No runtime dependencies, small footprint

---

<sup>1</sup> See [RFC conformance](#)

<sup>2</sup> With the exception of custom memory allocators (see [Memory management and reference counting](#))

---

CHAPTER  
TWO

---

CONTENTS

## 2.1 Getting started

Pre-built Linux packages are available in most mainstream distributions

**Ubuntu, Debian, etc.:**

```
apt-get install libcbor-dev
```

**Fedora, openSUSE, etc.:**

```
yum install libcbor-devel
```

**OS X** users can use [Homebrew](#):

```
brew install libcbor
```

For other platforms, you will need to compile it from source.

### 2.1.1 Building & installing libcbor

**Prerequisites:**

- C99 compiler
- [CMake](#) 2.8 or newer (might also be called `cmakesetup`, `cmake-gui` or `ccmake` depending on the installed version and system)
- C build system CMake can target (make, Apple Xcode, MinGW, ...)

**Configuration options**

A handful of configuration flags can be passed to `cmake`. The following table lists libcbor compile-time directives and several important generic flags.

Option	Meaning	Default	Possible values
CMAKE_C_COMPILER	C compiler to use	cc	gcc, clang, clang-3.5, ...
CMAKE_INSTALL_PREFIX	Installation prefix	System-dependent	/usr/local/lib, ...
BUILD_SHARED_LIBS	Build as a shared library	OFF	ON, OFF
HUGE_FUZZ	<i>Fuzz test</i> with 8GB of data	OFF	ON, OFF
SANE_MALLOC	Assume malloc will refuse unreasonable allocations	OFF	ON, OFF
COVERAGE	Generate test coverage instrumentation	OFF	ON, OFF
WITH_TESTS	Build unit tests (see <i>Development</i> )	OFF	ON, OFF

The following configuration options will also be defined as macros[#]\_ in `<cbor/common.h>` and can therefore be used in client code:

Option	Meaning	Default	Possible values
CBOR_CUSTOM_ALLOC	Enable custom allocator support	OFF	ON, OFF
CBOR_PRETTY_PRINTER	Include a pretty-printing routine	ON	ON, OFF
CBOR_BUFFER_GROWTH	Factor for buffer growth & shrinking	2	Decimals > 1

If you want to pass other custom configuration options, please refer to [http://www.cmake.org/Wiki/CMake\\_Useful\\_Variables](http://www.cmake.org/Wiki/CMake_Useful_Variables).

### Building using make

CMake will generate a Makefile and other configuration files for the build. As a rule of thumb, you should configure the build *outside of the source tree* in order to keep different configurations isolated. If you are unsure where to execute the build, just use a temporary directory:

```
cd $(mktemp -d /tmp/cbor_build.XXXX)
```

Now, assuming you are in the directory where you want to build, build libcbor as a **static library**:

```
cmake -DCMAKE_BUILD_TYPE=Release path_to_libcbor_dir
make cbor
```

... or as a **dynamic library**:

```
cmake -DCMAKE_BUILD_TYPE=Release -DBUILD_SHARED_LIBS=ON path_to_libcbor_dir
make cbor
```

To install locally:

```
make install
```

Root permissions are required on most systems when using the default installation prefix.

### Portability

libcbor is highly portable and works on both little- and big-endian systems regardless of the operating system. After building on an exotic platform, you might wish to verify the result by running the *test suite*. If you encounter any problems, please report them to the [issue tracker](#).

libcbor is known to successfully work on ARM Android devices. Cross-compilation is possible with `arm-linux-gnueabi-gcc`.

## 2.1.2 Linking with libcbor

If you include and linker paths include the directories to which libcbor has been installed, compiling programs that uses libcbor requires no extra considerations.

You can verify that everything has been set up properly by creating a file with the following contents

```
#include <cbor.h>
#include <stdio.h>

int main(int argc, char * argv[])
{
    printf("Hello from libcbor %s\n", CBOR_VERSION);
}
```

and compiling it

```
cc hello_cbor.c -lcbor -o hello_cbor
```

libcbor also comes with `pkg-config` support. If you install libcbor with a custom prefix, you can use `pkg-config` to resolve the headers and objects:

```
cc $(pkg-config --cflags libcbor) hello_cbor.c $(pkg-config --libs libcbor) -o hello_cbor
```

### A note on linkage

libcbor is primarily intended to be linked statically. The shared library versioning scheme generally follows SemVer, but is irregular for the 0.X.Y development branch for historical reasons. The following version identifiers are used as a part of the SONAME (Linux) or the dylib “Compatibility version” (OS X):

- 0.Y for the 0.Y.Z branch. Patches are backwards compatible, minor releases are generally not and require re-compilation of any dependent code.
- X for the X.Y.Z stable versions starting 1.X.Y. All minor release of the major version are backwards compatible.

**Warning:** Please note that releases up to and including v0.6.0 may export misleading .so/.dylib version number.

## 2.1.3 Troubleshooting

**cbor.h not found:** The headers directory is probably not in your include path. First, verify the installation location by checking the installation log. If you used make, it will look something like

```
...
-- Installing: /usr/local/include/cbor
-- Installing: /usr/local/include/cbor/callbacks.h
-- Installing: /usr/local/include/cbor/encoding.h
...
```

Make sure that `CMAKE_INSTALL_PREFIX` (if you provided it) was correct. Including the path path during compilation should suffice, e.g.:

```
cc -I/usr/local/include hello_cbor.c -lcbor -o hello_cbor
```

**cannot find -lcbor during linking:** Most likely the same problem as before. Include the installation directory in the linker shared path using `-R`, e.g.:

```
cc -Wl,-rpath,/usr/local/lib -lcbor -o hello_cbor
```

**shared library missing during execution:** Verify the linkage using `ldd`, `otool`, or similar and adjust the compilation directives accordingly:

```
ldd hello_cbor
 linux-vdso.so.1 => (0x00007ffe85585000)
 libcbor.so => /usr/local/lib/libcbor.so (0x00007f9af69da000)
 libc.so.6 => /lib/x86_64-linux-gnu/libc.so.6 (0x00007f9af65eb000)
 /lib64/ld-linux-x86-64.so.2 (0x00007f9af6be9000)
```

**compilation failed:** If your compiler supports C99 yet the compilation has failed, please report the issue to the [issue tracker](#).

## 2.2 Usage & preliminaries

### 2.2.1 Version information

libcbor exports its version using three self-explanatory macros:

- `CBOR_MAJOR_VERSION`
- `CBOR_MINOR_VERSION`
- `CBOR_PATCH_VERSION`

The `CBOR_VERSION` is a string concatenating these three identifiers into one (e.g. `0.2.0`).

In order to simplify version comparisons, the version is also exported as

```
#define CBOR_HEX_VERSION ((CBOR_MAJOR_VERSION << 16) | (CBOR_MINOR_VERSION << 8) |  
↪CBOR_PATCH_VERSION)
```

Since macros are difficult to work with through FFIs, the same information is also available through three `uint8_t` constants, namely

- `cbor_major_version`
- `cbor_minor_version`
- `cbor_patch_version`

### 2.2.2 Headers to include

The `cbor.h` header includes all the symbols. If, for any reason, you don't want to include all the exported symbols, feel free to use just some of the `cbor/*.h` headers:

- `cbor/arrays.h` - *Type 4 – Arrays*
- `cbor/bytestrings.h` - *Type 2 – Byte strings*
- `cbor/callbacks.h` - Callbacks used for *Decoding*
- `cbor/common.h` - Common utilities - always transitively included
- `cbor/data.h` - Data types definitions - always transitively included
- `cbor/encoding.h` - Streaming encoders for *Encoding*

- `cbor/floats_ctrls.h` - *Type 7 – Floats & control tokens*
- `cbor/ints.h` - *Types 0 & 1 – Positive and negative integers*
- `cbor/maps.h` - *Type 5 – Maps*
- `cbor/serialization.h` - High level serialization such as `cbor_serialize()`
- `cbor/streaming.h` - Home of `cbor_stream_decode()`
- `cbor/strings.h` - *Type 3 – UTF-8 strings*
- `cbor/tags.h` - *Type 6 – Semantic tags*

### 2.2.3 Using libcbor

If you want to get more familiar with CBOR, we recommend the [cbor.io](http://cbor.io) website. Once you get the grasp of what is it CBOR does, the examples (located in the `examples` directory) should give you a good feel of the API. The [API documentation](#) should then provide with all the information you may need.

#### Creating and serializing items

```
#include "cbor.h"
#include <stdio.h>

int main(int argc, char * argv[])
{
    /* Preallocate the map structure */
    cbor_item_t * root = cbor_new_definite_map(2);
    /* Add the content */
    cbor_map_add(root, (struct cbor_pair) {
        .key = cbor_move(cbor_build_string("Is CBOR awesome?")),
        .value = cbor_move(cbor_build_bool(true))
    });
    cbor_map_add(root, (struct cbor_pair) {
        .key = cbor_move(cbor_build_uint8(42)),
        .value = cbor_move(cbor_build_string("Is the answer"))
    });
    /* Output: `length` bytes of data in the `buffer` */
    unsigned char * buffer;
    size_t buffer_size, length = cbor_serialize_alloc(root, &buffer, &buffer_size);

    fwrite(buffer, 1, length, stdout);
    free(buffer);

    fflush(stdout);
    cbor_DECREF(&root);
}
```

#### Reading serialized data

```
#include "cbor.h"
#include <stdio.h>

/*
 * Reads data from a file. Example usage:
 * $ ./examples/readfile examples/data/nested_array.cbor
 */
```

(continues on next page)

(continued from previous page)

```

int main(int argc, char * argv[])
{
    FILE * f = fopen(argv[1], "rb");
    fseek(f, 0, SEEK_END);
    size_t length = (size_t)ftell(f);
    fseek(f, 0, SEEK_SET);
    unsigned char * buffer = malloc(length);
    fread(buffer, length, 1, f);

    /* Assuming `buffer` contains `info.st_size` bytes of input data */
    struct cbor_load_result result;
    cbor_item_t * item = cbor_load(buffer, length, &result);
    /* Pretty-print the result */
    cbor_describe(item, stdout);
    fflush(stdout);
    /* Deallocate the result */
    cbor_decref(&item);

    fclose(f);
}

```

## Using the streaming parser

```

#include "cbor.h"
#include <stdio.h>
#include <string.h>

/*
 * Illustrates how one might skim through a map (which is assumed to have
 * string keys and values only), looking for the value of a specific key
 *
 * Use the examples/data/map.cbor input to test this.
 */

const char * key = "a secret key";
bool key_found = false;

void find_string(void * _ctx, cbor_data buffer, size_t len)
{
    if (key_found) {
        printf("Found the value: %*s\n", (int) len, buffer);
        key_found = false;
    } else if (len == strlen(key)) {
        key_found = (memcmp(key, buffer, len) == 0);
    }
}

int main(int argc, char * argv[])
{
    FILE * f = fopen(argv[1], "rb");
    fseek(f, 0, SEEK_END);
    size_t length = (size_t)ftell(f);
    fseek(f, 0, SEEK_SET);
    unsigned char * buffer = malloc(length);
    fread(buffer, length, 1, f);

    struct cbor_callbacks callbacks = cbor_empty_callbacks;

```

(continues on next page)

(continued from previous page)

```

struct cbor_decoder_result decode_result;
size_t bytes_read = 0;
callbacks.string = find_string;
while (bytes_read < length) {
    decode_result = cbor_stream_decode(buffer + bytes_read,
                                       length - bytes_read,
                                       &callbacks, NULL);
    bytes_read += decode_result.read;
}

fclose(f);
}

```

## 2.3 API

The data API is centered around `cbor_item_t`, a generic handle for any CBOR item. There are functions to

- create items,
- set items' data,
- parse serialized data into items,
- manage, move, and links item together.

The single most important thing to keep in mind is: **`cbor_item_t` is an opaque type and should only be manipulated using the appropriate functions!** Think of it as an object.

The *libcbor* API closely follows the semantics outlined by [CBOR standard](#). This part of the documentation provides a short overview of the CBOR constructs, as well as a general introduction to the *libcbor* API. Remaining reference can be found in the following files structured by data types.

The API is designed to allow both very tight control & flexibility and general convenience with sane defaults.<sup>1</sup> For example, client with very specific requirements (constrained environment, custom application protocol built on top of CBOR, etc.) may choose to take full control (and responsibility) of memory and data structures management by interacting directly with the decoder. Other clients might want to take control of specific aspects (streamed collections, hash maps storage), but leave other responsibilities to *libcbor*. More general clients might prefer to be abstracted away from all aforementioned details and only be presented complete data structures.

### *libcbor* provides

- stateless encoders and decoders
- encoding and decoding *drivers*, routines that coordinate encoding and decoding of complex structures
- data structures to represent and transform CBOR structures
- routines for building and manipulating these structures
- utilities for inspection and debugging

---

<sup>1</sup> <http://softwareengineering.vazexqi.com/files/pattern.html>

### 2.3.1 Types of items

Every `cbor_item_t` has a `cbor_type` associated with it - these constants correspond to the types specified by the CBOR standard:

#### `enum cbor_type`

Specifies the Major type of `cbor_item_t`.

*Values:*

##### `CBOR_TYPE_UINT`

0 - positive integers

##### `CBOR_TYPE_NEGINT`

1 - negative integers

##### `CBOR_TYPE_BYTESTRING`

2 - byte strings

##### `CBOR_TYPE_STRING`

3 - strings

##### `CBOR_TYPE_ARRAY`

4 - arrays

##### `CBOR_TYPE_MAP`

5 - maps

##### `CBOR_TYPE_TAG`

6 - tags

##### `CBOR_TYPE_FLOAT_CTRL`

7 - decimals and special values (true, false, nil, ...)

To find out the type of an item, one can use

`cbor_type` `cbor_typeof (const cbor_item_t *item)`

Get the type of the item.

**Return** The type

**Parameters**

- `item[borrow]`:

Please note the distinction between functions like `cbor_isa_uint ()` and `cbor_is_int ()`. The following functions work solely with the major type value.

### Binary queries

Alternatively, there are functions to query each particular type.

**Warning:** Passing an invalid `cbor_item_t` reference to any of these functions results in undefined behavior.

`bool cbor_isa_uint (const cbor_item_t *item)`

Does the item have the appropriate major type?

**Return** Is the item an `CBOR_TYPE_UINT`?

**Parameters**

- item[borrow]: the item

bool **cbor\_isa\_negint** (**const cbor\_item\_t** \*item)

Does the item have the appropriate major type?

**Return** Is the item a *CBOR\_TYPE\_NEGINT*?

**Parameters**

- item[borrow]: the item

bool **cbor\_isa\_bytestring** (**const cbor\_item\_t** \*item)

Does the item have the appropriate major type?

**Return** Is the item a *CBOR\_TYPE\_BYTESTRING*?

**Parameters**

- item[borrow]: the item

bool **cbor\_isa\_string** (**const cbor\_item\_t** \*item)

Does the item have the appropriate major type?

**Return** Is the item a *CBOR\_TYPE\_STRING*?

**Parameters**

- item[borrow]: the item

bool **cbor\_isa\_array** (**const cbor\_item\_t** \*item)

Does the item have the appropriate major type?

**Return** Is the item an *CBOR\_TYPE\_ARRAY*?

**Parameters**

- item[borrow]: the item

bool **cbor\_isa\_map** (**const cbor\_item\_t** \*item)

Does the item have the appropriate major type?

**Return** Is the item a *CBOR\_TYPE\_MAP*?

**Parameters**

- item[borrow]: the item

bool **cbor\_isa\_tag** (**const cbor\_item\_t** \*item)

Does the item have the appropriate major type?

**Return** Is the item a *CBOR\_TYPE\_TAG*?

**Parameters**

- item[borrow]: the item

bool **cbor\_isa\_float\_ctrl** (**const cbor\_item\_t** \*item)

Does the item have the appropriate major type?

**Return** Is the item a *CBOR\_TYPE\_FLOAT\_CTRL*?

**Parameters**

- `item[borrow]`: the item

## Logical queries

These functions provide information about the item type from a more high-level perspective

`bool cbor_is_int (const cbor_item_t *item)`

Is the item an integer, either positive or negative?

**Return** Is the item an integer, either positive or negative?

**Parameters**

- `item[borrow]`: the item

`bool cbor_is_float (const cbor_item_t *item)`

Is the item an a floating point number?

**Return** Is the item a floating point number?

**Parameters**

- `item[borrow]`: the item

`bool cbor_is_bool (const cbor_item_t *item)`

Is the item an a boolean?

**Return** Is the item a boolean?

**Parameters**

- `item[borrow]`: the item

`bool cbor_is_null (const cbor_item_t *item)`

Does this item represent null

**Warning:** This is in no way related to the value of the pointer. Passing a null pointer will most likely result in a crash.

**Return** Is the item (CBOR logical) null?

**Parameters**

- `item[borrow]`: the item

`bool cbor_is_undef (const cbor_item_t *item)`

Does this item represent undefined

**Warning:** Care must be taken to distinguish nulls and undefined values in C.

**Return** Is the item (CBOR logical) undefined?

## Parameters

- item[borrow]: the item

### 2.3.2 Memory management and reference counting

Due to the nature of its domain, *libcbor* will need to work with heap memory. The stateless decoder and encoder don't allocate any memory.

If you have specific requirements, you should consider rolling your own driver for the stateless API.

#### Using custom allocator

*libcbor* gives you with the ability to provide your own implementations of malloc, realloc, and free. This can be useful if you are using a custom allocator throughout your application, or if you want to implement custom policies (e.g. tighter restrictions on the amount of allocated memory).

In order to use this feature, *libcbor* has to be compiled with the *appropriate flags*. You can verify the configuration using the CBOR\_CUSTOM\_ALLOC macro. A simple usage might be as follows:

```
#if CBOR_CUSTOM_ALLOC
    cbor_set_allocs(malloc, realloc, free);
#else
    #error "libcbor built with support for custom allocation is required"
#endif
```

void **cbor\_set\_allocs** (\_cbor\_malloc\_t *custom\_malloc*, \_cbor\_realloc\_t *custom\_realloc*, \_cbor\_free\_t  
*custom\_free*)

Sets the memory management routines to use.

Only available when CBOR\_CUSTOM\_ALLOC is truthy

**Warning:** This function modifies the global state and should therefore be used accordingly. Changing the memory handlers while allocated items exist will result in a free/malloc mismatch. This function is not thread safe with respect to both itself and all the other *libcbor* functions that work with the heap.

---

**Note:** realloc implementation must correctly support *NULL* reallocation (see e.g. <http://en.cppreference.com/w/c/memory/realloc>)

---

## Parameters

- *custom\_malloc*: malloc implementation
- *custom\_realloc*: realloc implementation
- *custom\_free*: free implementation

## Reference counting

As CBOR items may require complex cleanups at the end of their lifetime, there is a reference counting mechanism in place. This also enables very simple GC when integrating *libcbor* into managed environment. Every item starts its life (by either explicit creation, or as a result of parsing) with reference count set to 1. When the refcount reaches zero, it will be destroyed.

Items containing nested items will be destroyed recursively - refcount of every nested item will be decreased by one.

The destruction is synchronous and renders any pointers to items with refcount zero invalid immediately after calling the `cbor_decref()`.

`cbor_item_t *cbor_incref(cbor_item_t *item)`

Increases the reference count by one.

No dependent items are affected.

**Return** the input reference

### Parameters

- `item[incref]`: item the item

`void cbor_decref(cbor_item_t **item)`

Decreases the reference count by one, deallocating the item if needed.

In case the item is deallocated, the reference count of any dependent items is adjusted accordingly in a recursive manner.

### Parameters

- `item[take]`: the item. Set to NULL if deallocated

`void cbor_intermediate_decref(cbor_item_t *item)`

Decreases the reference count by one, deallocating the item if needed.

Convenience wrapper for `cbor_decref` when its set-to-null behavior is not needed

### Parameters

- `item[take]`: the item

`size_t cbor_refcount(const cbor_item_t *item)`

Get the reference count.

**Warning:** This does *not* account for transitive references.

**Return** the reference count

### Parameters

- `item[borrow]`: the item

`cbor_item_t *cbor_move(cbor_item_t *item)`

Provides CPP-like move construct.

Decreases the reference count by one, but does not deallocate the item even if its refcount reaches zero. This is useful for passing intermediate values to functions that increase reference count. Should only be used with functions that `incref` their arguments.

**Warning:** If the item is moved without correctly increasing the reference count afterwards, the memory will be leaked.

**Return** the item with reference count decreased by one

#### Parameters

- `item[take]`: the item

`cbor_item_t *cbor_copy (cbor_item_t *item)`

Deep copy of an item.

All the reference counts in the new structure are set to one.

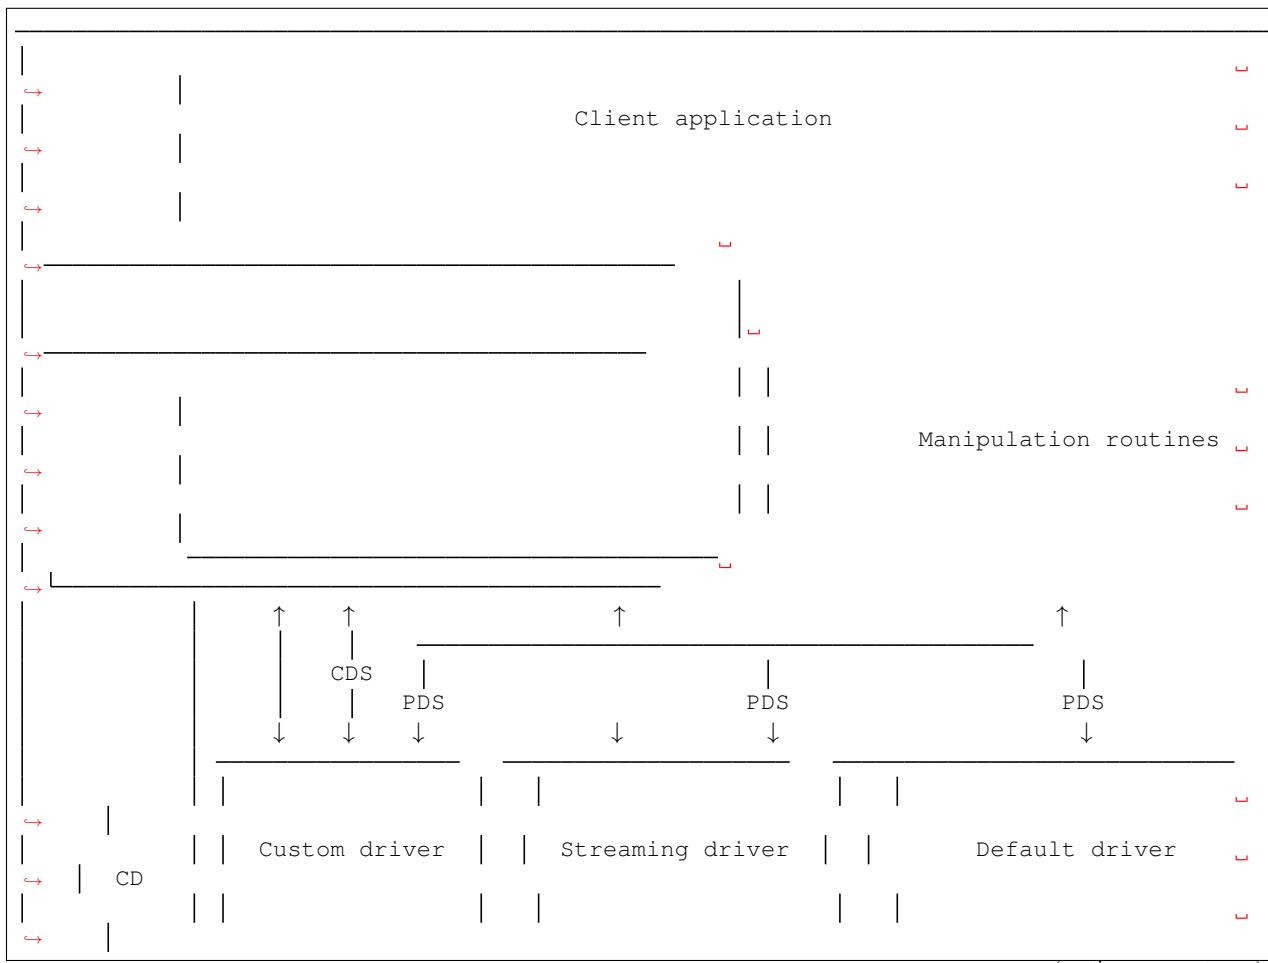

**Return** new CBOR deep copy

#### Parameters

- `item[borrow]`: item to copy

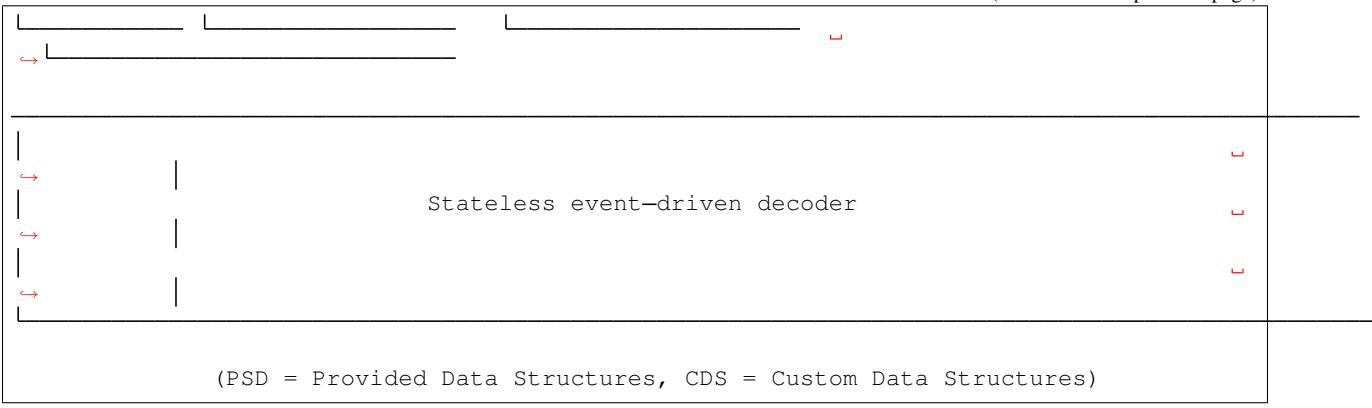

### 2.3.3 Decoding

The following diagram illustrates the relationship among different parts of libcbor from the decoding standpoint.

(continues on next page)

(continued from previous page)

This section will deal with the API that is labeled as the “Default driver” in the diagram. That is, routines that decode complete libcbor data items

`cbor_item_t *cbor_load(cbor_data source, size_t source_size, struct cbor_load_result *result)`  
Loads data item from a buffer.

**Return** new CBOR item or NULL on failure. In that case, result contains location and description of the error.

#### Parameters

- `source`: The buffer
- `source_size`:
- `result [out]`: Result indicator. `CBOR_ERR_NONE` on success

#### Associated data structures

`enum cbor_error_code`  
Possible decoding errors.

*Values:*

`CBOR_ERR_NONE`

`CBOR_ERR_NOTENOUGHDATA`

`CBOR_ERR_NODATA`

`CBOR_ERR_MALFORMATED`

`CBOR_ERR_MEMERROR`

Memory error - item allocation failed.

Is it too big for your allocator?

`CBOR_ERR_SYNTAXERROR`

Stack parsing algorithm failed.

`struct cbor_load_result`

High-level decoding result.

## Public Members

**struct cbor\_error error**

Error indicator.

**size\_t read**

Number of bytes read.

**struct cbor\_error**

High-level decoding error.

## Public Members

**size\_t position**

Aproximate position.

**cbor\_error\_code code**

Description.

### 2.3.4 Encoding

The easiest way to encode data items is using the `cbor_serialize()` or `cbor_serialize_alloc()` functions:

`size_t cbor_serialize(const cbor_item_t *item, cbor_mutable_data buffer, size_t buffer_size)`  
Serialize the given item.

**Return** Length of the result. 0 on failure.

#### Parameters

- `item[borrow]`: A data item
- `buffer`: Buffer to serialize to
- `buffer_size`: Size of the buffer

`size_t cbor_serialize_alloc(const cbor_item_t *item, cbor_mutable_data *buffer, size_t *buffer_size)`  
Serialize the given item, allocating buffers as needed.

**Warning:** It is your responsibility to free the buffer using an appropriate `free` implementation.

**Return** Length of the result. 0 on failure, in which case `buffer` is NULL.

#### Parameters

- `item[borrow]`: A data item
- `buffer[out]`: Buffer containing the result
- `buffer_size[out]`: Size of the buffer

## Type-specific serializers

In case you know the type of the item you want to serialize beforehand, you can use one of the type-specific serializers.

---

**Note:** Unless compiled in debug mode, these do not verify the type. Passing an incorrect item will result in an undefined behavior.

---

`size_t cbor_serialize_uint (const cbor_item_t *, cbor_mutable_data, size_t)`  
Serialize an uint.

**Return** Length of the result. 0 on failure.

### Parameters

- `item[borrow]`: A uint
- `buffer`: Buffer to serialize to
- `buffer_size`: Size of the buffer

`size_t cbor_serialize_negint (const cbor_item_t *, cbor_mutable_data, size_t)`  
Serialize a negint.

**Return** Length of the result. 0 on failure.

### Parameters

- `item[borrow]`: A negint
- `buffer`: Buffer to serialize to
- `buffer_size`: Size of the buffer

`size_t cbor_serialize_bytestring (const cbor_item_t *, cbor_mutable_data, size_t)`  
Serialize a bytestring.

**Return** Length of the result. 0 on failure.

### Parameters

- `item[borrow]`: A bytestring
- `buffer`: Buffer to serialize to
- `buffer_size`: Size of the buffer

`size_t cbor_serialize_string (const cbor_item_t *, cbor_mutable_data, size_t)`  
Serialize a string.

**Return** Length of the result. 0 on failure.

### Parameters

- `item[borrow]`: A string
- `buffer`: Buffer to serialize to
- `buffer_size`: Size of the buffer

`size_t cbor_serialize_array (const cbor_item_t *, cbor_mutable_data, size_t)`  
Serialize an array.

**Return** Length of the result. 0 on failure.

#### Parameters

- item[borrow]: An array
- buffer: Buffer to serialize to
- buffer\_size: Size of the buffer

`size_t cbor_serialize_map(const cbor_item_t *, cbor_mutable_data, size_t)`  
Serialize a map.

**Return** Length of the result. 0 on failure.

#### Parameters

- item[borrow]: A map
- buffer: Buffer to serialize to
- buffer\_size: Size of the buffer

`size_t cbor_serialize_tag(const cbor_item_t *, cbor_mutable_data, size_t)`  
Serialize a tag.

**Return** Length of the result. 0 on failure.

#### Parameters

- item[borrow]: A tag
- buffer: Buffer to serialize to
- buffer\_size: Size of the buffer

`size_t cbor_serialize_float_ctrl(const cbor_item_t *, cbor_mutable_data, size_t)`  
Serialize a.

**Return** Length of the result. 0 on failure.

#### Parameters

- item[borrow]: A float or ctrl
- buffer: Buffer to serialize to
- buffer\_size: Size of the buffer

### 2.3.5 Types 0 & 1 – Positive and negative integers

*CBOR* has two types of integers – positive (which may be effectively regarded as unsigned), and negative. There are four possible widths for an integer – 1, 2, 4, or 8 bytes. These are represented by

`enum cbor_int_width`

Possible widths of `CBOR_TYPE_UINT` items.

*Values:*

`CBOR_INT_8`

`CBOR_INT_16`

`CBOR_INT_32`

## CBOR\_INT\_64

### Type 0 - positive integers

Corresponding <code>cbor_type</code>	CBOR_TYPE_UINT
Number of allocations	One per lifetime
Storage requirements	<code>sizeof(cbor_item_t) + sizeof(uint*_t)</code>

**Note:** once a positive integer has been created, its width *cannot* be changed.

### Type 1 - negative integers

Corresponding <code>cbor_type</code>	CBOR_TYPE_NEGINT
Number of allocations	One per lifetime
Storage requirements	<code>sizeof(cbor_item_t) + sizeof(uint*_t)</code>

**Note:** once a positive integer has been created, its width *cannot* be changed.

### Type 0 & 1

Due to their largely similar semantics, the following functions can be used for both Type 0 and Type 1 items. One can convert between them freely using *the conversion functions*.

Actual Type of the integer can be checked using *item types API*.

An integer item is created with one of the four widths. Because integers' storage is bundled together with the handle, the width cannot be changed over its lifetime.

**Warning:** Due to the fact that CBOR negative integers represent integers in the range  $[-1, -2^N]$ , `cbor_set_uint` API is somewhat counter-intuitive as the resulting logical value is 1 less. This behavior is necessary in order to permit uniform manipulation with the full range of permitted values. For example, the following snippet

```
cbor_item_t * item = cbor_new_int8();
cbor_mark_negint(item);
cbor_set_uint8(0);
```

will produce an item with the logical value of  $-1$ . There is, however, an upside to this as well: There is only one representation of zero.

## Building new items

`cbor_item_t *cbor_build_uint8 (uint8_t value)`

Constructs a new positive integer.

**Return** new positive integer or NULL on memory allocation failure

### Parameters

- `value`: the value to use

`cbor_item_t *cbor_build_uint16 (uint16_t value)`

Constructs a new positive integer.

**Return** new positive integer or NULL on memory allocation failure

**Parameters**

- value: the value to use

`cbor_item_t *cbor_build_uint32 (uint32_t value)`

Constructs a new positive integer.

**Return** new positive integer or NULL on memory allocation failure

**Parameters**

- value: the value to use

`cbor_item_t *cbor_build_uint64 (uint64_t value)`

Constructs a new positive integer.

**Return** new positive integer or NULL on memory allocation failure

**Parameters**

- value: the value to use

## Retrieving values

`uint8_t cbor_get_uint8 (const cbor_item_t *item)`

Extracts the integer value.

**Return** the value

**Parameters**

- item[borrow]: positive or negative integer

`uint16_t cbor_get_uint16 (const cbor_item_t *item)`

Extracts the integer value.

**Return** the value

**Parameters**

- item[borrow]: positive or negative integer

`uint32_t cbor_get_uint32 (const cbor_item_t *item)`

Extracts the integer value.

**Return** the value

**Parameters**

- item[borrow]: positive or negative integer

`uint64_t cbor_get_uint64 (const cbor_item_t *item)`

Extracts the integer value.

**Return** the value

#### Parameters

- item[borrow]: positive or negative integer item

### Setting values

void **cbor\_set\_uint8** (*cbor\_item\_t* \*item, *uint8\_t* value)

Assigns the integer value.

#### Parameters

- item[borrow]: positive or negative integer item
- value: the value to assign. For negative integer, the logical value is `-value - 1`

void **cbor\_set\_uint16** (*cbor\_item\_t* \*item, *uint16\_t* value)

Assigns the integer value.

#### Parameters

- item[borrow]: positive or negative integer item
- value: the value to assign. For negative integer, the logical value is `-value - 1`

void **cbor\_set\_uint32** (*cbor\_item\_t* \*item, *uint32\_t* value)

Assigns the integer value.

#### Parameters

- item[borrow]: positive or negative integer item
- value: the value to assign. For negative integer, the logical value is `-value - 1`

void **cbor\_set\_uint64** (*cbor\_item\_t* \*item, *uint64\_t* value)

Assigns the integer value.

#### Parameters

- item[borrow]: positive or negative integer item
- value: the value to assign. For negative integer, the logical value is `-value - 1`

### Dealing with width

*cbor\_int\_width* **cbor\_int\_get\_width** (*const cbor\_item\_t* \*item)

Queries the integer width.

**Return** the width

#### Parameters

- item[borrow]: positive or negative integer item

## Dealing with signedness

`void cbor_mark_uint (cbor_item_t *item)`  
Marks the integer item as a positive integer.

The data value is not changed

### Parameters

- `item[borrow]`: positive or negative integer item

`void cbor_mark_negint (cbor_item_t *item)`  
Marks the integer item as a negative integer.

The data value is not changed

### Parameters

- `item[borrow]`: positive or negative integer item

## Creating new items

`cbor_item_t *cbor_new_int8 ()`  
Allocates new integer with 1B width.

The width cannot be changed once allocated

**Return** `new` positive integer or `NULL` on memory allocation failure. The value is not initialized

`cbor_item_t *cbor_new_int16 ()`  
Allocates new integer with 2B width.

The width cannot be changed once allocated

**Return** `new` positive integer or `NULL` on memory allocation failure. The value is not initialized

`cbor_item_t *cbor_new_int32 ()`  
Allocates new integer with 4B width.

The width cannot be changed once allocated

**Return** `new` positive integer or `NULL` on memory allocation failure. The value is not initialized

`cbor_item_t *cbor_new_int64 ()`  
Allocates new integer with 8B width.

The width cannot be changed once allocated

**Return** `new` positive integer or `NULL` on memory allocation failure. The value is not initialized

## 2.3.6 Type 2 – Byte strings

CBOR byte strings are just (ordered) series of bytes without further interpretation (unless there is a [tag](#)). Byte string's length may or may not be known during encoding. These two kinds of byte strings can be distinguished using `cbor_bytestring_is_definite()` and `cbor_bytestring_is_indefinite()` respectively.

In case a byte string is indefinite, it is encoded as a series of definite byte strings. These are called “chunks”. For example, the encoded item

```
0xf5      Start indefinite byte string
  0x41    Byte string (1B long)
    0x00
  0x41    Byte string (1B long)
    0xff
  0xff    "Break" control token
```

represents two bytes, 0x00 and 0xff. This on one hand enables streaming messages even before they are fully generated, but on the other hand it adds more complexity to the client code.

Corresponding <code>cbor_type</code>	<code>CBOR_TYPE_BYTESTRING</code>
Number of allocations (definite)	One plus any manipulations with the data
Number of allocations (indefinite)	One plus logarithmically many reallocations relative to chunk count
Storage requirements (definite)	<code>sizeof(cbor_item_t) + length(handle)</code>
Storage requirements (indefinite)	<code>sizeof(cbor_item_t) * (1 + chunk_count) + chunks</code>

### Streaming indefinite byte strings

Please refer to [Streaming & indefinite items](#).

#### Getting metadata

`size_t cbor_bytestring_length(const cbor_item_t *item)`

Returns the length of the binary data.

For definite byte strings only

**Return** length of the binary data. Zero if no chunk has been attached yet

#### Parameters

- `item[borrow]`: a definite bytestring

`bool cbor_bytestring_is_definite(const cbor_item_t *item)`

Is the byte string definite?

**Return** Is the byte string definite?

#### Parameters

- `item[borrow]`: a byte string

`bool cbor_bytestring_is_indefinite(const cbor_item_t *item)`

Is the byte string indefinite?

**Return** Is the byte string indefinite?

**Parameters**

- item[borrow]: a byte string

`size_t cbor_bytestring_chunk_count (const cbor_item_t *item)`

Get the number of chunks this string consist of.

**Return** The chunk count. 0 for freshly created items.

**Parameters**

- item[borrow]: A indefinite bytestring

**Reading data**

`cbor_mutable_data cbor_bytestring_handle (const cbor_item_t *item)`

Get the handle to the binary data.

Definite items only. Modifying the data is allowed. In that case, the caller takes responsibility for the effect on items this item might be a part of

**Return** The address of the binary data. NULL if no data have been assigned yet.

**Parameters**

- item[borrow]: A definite byte string

`cbor_item_t **cbor_bytestring_chunks_handle (const cbor_item_t *item)`

Get the handle to the array of chunks.

Manipulations with the memory block (e.g. sorting it) are allowed, but the validity and the number of chunks must be retained.

**Return** array of `cbor_bytestring_chunk_count` definite bytestrings

**Parameters**

- item[borrow]: A indefinite byte string

**Creating new items**

`cbor_item_t *cbor_new_definite_bytestring ()`

Creates a new definite byte string.

The handle is initialized to NULL and length to 0

**Return** new definite bytestring. NULL on malloc failure.

`cbor_item_t *cbor_new_indefinite_bytestring ()`

Creates a new indefinite byte string.

The chunks array is initialized to NULL and chunkcount to 0

**Return** new indefinite bytestring. NULL on malloc failure.

## Building items

`cbor_item_t *cbor_build_bytestring (cbor_data handle, size_t length)`

Creates a new byte string and initializes it.

The handle will be copied to a newly allocated block

**Return** A new byte string with content handle. NULL on malloc failure.

### Parameters

- handle: Block of binary data
- length: Length of data

## Manipulating existing items

`void cbor_bytestring_set_handle (cbor_item_t *item, cbor_mutable_data data, size_t length)`

Set the handle to the binary data.

### Parameters

- item[borrow]: A definite byte string
- data: The memory block. The caller gives up the ownership of the block. libcbor will deallocate it when appropriate using its free function
- length: Length of the data block

`bool cbor_bytestring_add_chunk (cbor_item_t *item, cbor_item_t *chunk)`

Appends a chunk to the bytestring.

Indefinite byte strings only.

May realloc the chunk storage.

**Return** true on success, false on realloc failure. In that case, the refcount of chunk is not increased and the item is left intact.

### Parameters

- item[borrow]: An indefinite byte string
- item[incref]: A definite byte string

## 2.3.7 Type 3 – UTF-8 strings

CBOR strings work in much the same ways as [Type 2 – Byte strings](#).

Corresponding <code>cbor_type</code>	CBOR_TYPE_STRING
Number of allocations (definite)	One plus any manipulations with the data
Number of allocations (indefinite)	One plus logarithmically many reallocations relative to chunk count
Storage requirements (definite)	<code>sizeof (cbor_item_t) + length (handle)</code>
Storage requirements (indefinite)	<code>sizeof (cbor_item_t) * (1 + chunk_count) + chunks</code>

## Streaming indefinite strings

Please refer to *Streaming & indefinite items*.

## UTF-8 encoding validation

*libcbor* considers UTF-8 encoding validity to be a part of the well-formedness notion of CBOR and therefore invalid UTF-8 strings will be rejected by the parser. Strings created by the user are not checked.

## Getting metadata

`size_t cbor_string_length(const cbor_item_t *item)`

Returns the length of the underlying string.

For definite strings only

**Return** length of the string. Zero if no chunk has been attached yet

### Parameters

- `item[borrow]`: a definite string

`bool cbor_string_is_definite(const cbor_item_t *item)`

Is the string definite?

**Return** Is the string definite?

### Parameters

- `item[borrow]`: a string

`bool cbor_string_is_indefinite(const cbor_item_t *item)`

Is the string indefinite?

**Return** Is the string indefinite?

### Parameters

- `item[borrow]`: a string

`size_t cbor_string_chunk_count(const cbor_item_t *item)`

Get the number of chunks this string consist of.

**Return** The chunk count. 0 for freshly created items.

### Parameters

- `item[borrow]`: A indefinite string

## Reading data

`cbor_mutable_data cbor_string_handle (const cbor_item_t *item)`

Get the handle to the underlying string.

Definite items only. Modifying the data is allowed. In that case, the caller takes responsibility for the effect on items this item might be a part of

**Return** The address of the underlying string. `NULL` if no data have been assigned yet.

### Parameters

- `item[borrow]`: A definite string

`cbor_item_t **cbor_string_chunks_handle (const cbor_item_t *item)`

Get the handle to the array of chunks.

Manipulations with the memory block (e.g. sorting it) are allowed, but the validity and the number of chunks must be retained.

**Return** array of `cbor_string_chunk_count` definite strings

### Parameters

- `item[borrow]`: A indefinite string

## Creating new items

`cbor_item_t *cbor_new_definite_string()`

Creates a new definite string.

The handle is initialized to `NULL` and length to 0

**Return** new definite string. `NULL` on malloc failure.

`cbor_item_t *cbor_new_indefinite_string()`

Creates a new indefinite string.

The chunks array is initialized to `NULL` and chunkcount to 0

**Return** new indefinite string. `NULL` on malloc failure.

## Building items

`cbor_item_t *cbor_build_string (const char *val)`

Creates a new string and initializes it.

The `val` will be copied to a newly allocated block

**Return** A new string with content handle. `NULL` on malloc failure.

### Parameters

- `val`: A null-terminated UTF-8 string

## Manipulating existing items

`void cbor_string_set_handle (cbor_item_t *item, cbor_mutable_data data, size_t length)`  
Set the handle to the underlying string.

**Warning:** Using a pointer to a stack allocated constant is a common mistake. Lifetime of the string will expire when it goes out of scope and the CBOR item will be left inconsistent.

### Parameters

- `item[borrow]`: A definite string
- `data`: The memory block. The caller gives up the ownership of the block. libcbor will deallocate it when appropriate using its free function
- `length`: Length of the data block

`bool cbor_string_add_chunk (cbor_item_t *item, cbor_item_t *chunk)`  
Appends a chunk to the string.

Indefinite strings only.

May realloc the chunk storage.

**Return** true on success. false on realloc failure. In that case, the refcount of `chunk` is not increased and the `item` is left intact.

### Parameters

- `item[borrow]`: An indefinite string
- `item[incref]`: A definite string

## 2.3.8 Type 4 – Arrays

CBOR arrays, just like `byte strings` and `strings`, can be encoded either as definite, or as indefinite.

Corresponding <code>cbor_type</code>	CBOR_TYPE_ARRAY
Number of allocations (definite)	Two plus any manipulations with the data
Number of allocations (indefinite)	Two plus logarithmically many reallocations relative to additions
Storage requirements (definite)	<code>(sizeof(cbor_item_t) + 1) * size</code>
Storage requirements (indefinite)	<code>&lt;= sizeof(cbor_item_t) + sizeof(cbor_item_t) * size * BUFFER_GROWTH</code>

## Examples

```
0x9f      Start indefinite array
  0x01      Unsigned integer 1
  0xff      "Break" control token
```

```
0x9f      Start array, 1B length follows
  0x20      Unsigned integer 32
  ...       32 items follow
```

## Streaming indefinite arrays

Please refer to *Streaming & indefinite items*.

## Getting metadata

`size_t cbor_array_size(const cbor_item_t *item)`

Get the number of members.

**Return** The number of members

### Parameters

- `item[borrow]`: An array

`size_t cbor_array_allocated(const cbor_item_t *item)`

Get the size of the allocated storage.

**Return** The size of the allocated storage (number of items)

### Parameters

- `item[borrow]`: An array

`bool cbor_array_is_definite(const cbor_item_t *item)`

Is the array definite?

**Return** Is the array definite?

### Parameters

- `item[borrow]`: An array

`bool cbor_array_is_indefinite(const cbor_item_t *item)`

Is the array indefinite?

**Return** Is the array indefinite?

### Parameters

- `item[borrow]`: An array

## Reading data

`cbor_item_t **cbor_array_handle (const cbor_item_t *item)`

Get the array contents.

The items may be reordered and modified as long as references remain consistent.

**Return** `cbor_array_size` items

**Parameters**

- `item[borrow]`: An array

`cbor_item_t *cbor_array_get (const cbor_item_t *item, size_t index)`

Get item by index.

**Return** `inref` The item, or `NULL` in case of boundary violation

**Parameters**

- `item[borrow]`: An array
- `index`: The index

## Creating new items

`cbor_item_t *cbor_new_definite_array (size_t size)`

Create new definite array.

**Return** new array or `NULL` upon malloc failure

**Parameters**

- `size`: Number of slots to preallocate

`cbor_item_t *cbor_new_indefinite_array ()`

Create new indefinite array.

**Return** new array or `NULL` upon malloc failure

## Modifying items

`bool cbor_array_push (cbor_item_t *array, cbor_item_t *pushee)`

Append to the end.

For indefinite items, storage may be reallocated. For definite items, only the preallocated capacity is available.

**Return** true on success, false on failure

**Parameters**

- `array[borrow]`: An array
- `pushee[inref]`: The item to push

`bool cbor_array_replace (cbor_item_t *item, size_t index, cbor_item_t *value)`

Replace item at an index.

The item being replace will be `cbor_DECREF` ‘ed.

**Return** true on success, false on allocation failure.

#### Parameters

- item[borrow]: An array
- value[incref]: The item to assign
- index: The index, first item is 0.

bool **cbor\_array\_set** (*cbor\_item\_t* \**item*, *size\_t* *index*, *cbor\_item\_t* \**value*)

Set item by index.

Creating arrays with holes is not possible

**Return** true on success, false on allocation failure.

#### Parameters

- item[borrow]: An array
- value[incref]: The item to assign
- index: The index, first item is 0.

### 2.3.9 Type 5 – Maps

CBOR maps are the plain old associate hash maps known from JSON and many other formats and languages, with one exception: any CBOR data item can be a key, not just strings. This is somewhat unusual and you, as an application developer, should keep that in mind.

Maps can be either definite or indefinite, in much the same way as *Type 4 – Arrays*.

Corresponding <i>cbor_type</i>	CBOR_TYPE_MAP
Number of allocations (definite)	Two plus any manipulations with the data
Number of allocations (indefinite)	Two plus logarithmically many reallocations relative to additions
Storage requirements (definite)	<code>sizeof(cbor_pair) * size + sizeof(cbor_item_t)</code>
Storage requirements (indefinite)	<code>&lt;= sizeof(cbor_item_t) + sizeof(cbor_pair) * size * BUFFER_GROWTH</code>

#### Streaming maps

Please refer to *Streaming & indefinite items*.

## Getting metadata

`size_t cbor_map_size(const cbor_item_t *item)`

Get the number of pairs.

**Return** The number of pairs

### Parameters

- `item[borrow]`: A map

`size_t cbor_map_allocated(const cbor_item_t *item)`

Get the size of the allocated storage.

**Return** Allocated storage size (as the number of cbor\_pair items)

### Parameters

- `item[borrow]`: A map

`bool cbor_map_is_definite(const cbor_item_t *item)`

Is this map definite?

**Return** Is this map definite?

### Parameters

- `item[borrow]`: A map

`bool cbor_map_is_indefinite(const cbor_item_t *item)`

Is this map indefinite?

**Return** Is this map indefinite?

### Parameters

- `item[borrow]`: A map

## Reading data

`struct cbor_pair *cbor_map_handle(const cbor_item_t *item)`

Get the pairs storage.

**Return** Array of `cbor_map_size` pairs. Manipulation is possible as long as references remain valid.

### Parameters

- `item[borrow]`: A map

## Creating new items

`cbor_item_t *cbor_new_definite_map(size_t size)`  
Create a new definite map.

**Return** new definite map. NULL on malloc failure.

### Parameters

- `size`: The number of slots to preallocate

`cbor_item_t *cbor_new_indefinite_map()`  
Create a new indefinite map.

**Return** new definite map. NULL on malloc failure.

### Parameters

- `size`: The number of slots to preallocate

## Modifying items

`bool cbor_map_add(cbor_item_t *item, struct cbor_pair pair)`  
Add a pair to the map.

For definite maps, items can only be added to the preallocated space. For indefinite maps, the storage will be expanded as needed

**Return** true on success, false if either reallocation failed or the preallcoated storage is full

### Parameters

- `item[borrow]`: A map
- `pair[inref]`: The key-value pair to add (inref is member-wise)

## 2.3.10 Type 6 – Semantic tags

Tag are additional metadata that can be used to extend or specialize the meaning or interpretation of the other data items.

For example, one might tag an array of numbers to communicate that it should be interpreted as a vector.

Please consult the official IANA repository of CBOR tags before inventing new ones.

Corresponding <code>cbor_type</code>	CBOR_TYPE_TAG
Number of allocations	One plus any manipulations with the data reallocations relative to chunk count
Storage requirements	<code>sizeof(cbor_item_t) + the tagged item</code>

`cbor_item_t *cbor_new_tag(uint64_t value)`  
Create a new tag.

**Return** new tag. Item reference is NULL. Returns NULL upon memory allocation failure

### Parameters

- `value`: The tag value. Please consult the tag repository

---

`cbor_item_t *cbor_tag_item(const cbor_item_t *item)`  
Get the tagged item.

**Return** `inref` the tagged item

**Parameters**

- `item[borrow]`: A tag

`uint64_t cbor_tag_value(const cbor_item_t *item)`  
Get tag value.

**Return** The tag value. Please consult the tag repository

**Parameters**

- `item[borrow]`: A tag

`void cbor_tag_set_item(cbor_item_t *item, cbor_item_t *tagged_item)`  
Set the tagged item.

**Parameters**

- `item[borrow]`: A tag
- `tagged_item[inref]`: The item to tag

### 2.3.11 Type 7 – Floats & control tokens

This type combines two completely unrelated types of items – floating point numbers and special values such as true, false, null, etc. We refer to these special values as ‘control values’ or ‘ctrls’ for short throughout the code.

Just like integers, they have different possible width (resulting in different value ranges and precisions).

**enum cbor\_float\_width**

Possible widths of `CBOR_TYPE_FLOAT_CTRL` items.

*Values:*

**CBOR\_FLOAT\_0**

Internal use - ctrl and special values.

**CBOR\_FLOAT\_16**

Half float.

**CBOR\_FLOAT\_32**

Single float.

**CBOR\_FLOAT\_64**

Double.

Corresponding <code>cbor_type</code>	<code>CBOR_TYPE_FLOAT_CTRL</code>
Number of allocations	One per lifetime
Storage requirements	<code>sizeof(cbor_item_t) + 1/4/8</code>

## Getting metadata

`bool cbor_float_ctrl_is_ctrl(const cbor_item_t *item)`  
Is this a ctrl value?

**Return** Is this a ctrl value?

### Parameters

- `item[borrow]`: A float or ctrl item

`cbor_float_width cbor_float_get_width(const cbor_item_t *item)`  
Get the float width.

**Return** The width.

### Parameters

- `item[borrow]`: A float or ctrl item

## Reading data

`float cbor_float_get_float2(const cbor_item_t *item)`  
Get a half precision float.

The item must have the corresponding width

### Parameters

- 

`float cbor_float_get_float4(const cbor_item_t *item)`  
Get a single precision float.

The item must have the corresponding width

### Parameters

- 

`double cbor_float_get_float8(const cbor_item_t *item)`  
Get a double precision float.

The item must have the corresponding width

### Parameters

- 

`double cbor_float_get_float(const cbor_item_t *item)`  
Get the float value represented as double.

Can be used regardless of the width.

### Parameters

-

```
uint8_t cbor_ctrl_value (const cbor_item_t *item)
```

Reads the control value.

**Return** the simple value

#### Parameters

- item[borrow]: A ctrl item

```
bool cbor_get_bool (const cbor_item_t *item)
```

Get value from a boolean ctrl item.

**Return** boolean value

#### Parameters

- item[borrow]: A ctrl item

## Creating new items

```
cbor_item_t *cbor_new_ctrl ()
```

Constructs a new ctrl item.

The width cannot be changed once the item is created

**Return** new 1B ctrl or NULL upon memory allocation failure

```
cbor_item_t *cbor_new_float2 ()
```

Constructs a new float item.

The width cannot be changed once the item is created

**Return** new 2B float or NULL upon memory allocation failure

```
cbor_item_t *cbor_new_float4 ()
```

Constructs a new float item.

The width cannot be changed once the item is created

**Return** new 4B float or NULL upon memory allocation failure

```
cbor_item_t *cbor_new_float8 ()
```

Constructs a new float item.

The width cannot be changed once the item is created

**Return** new 8B float or NULL upon memory allocation failure

```
cbor_item_t *cbor_new_null ()
```

Constructs new null ctrl item.

**Return** new null ctrl item or NULL upon memory allocation failure

```
cbor_item_t *cbor_new_undef ()
```

Constructs new undef ctrl item.

**Return** new undef ctrl item or NULL upon memory allocation failure

## Building items

`cbor_item_t *cbor_build_bool (bool value)`

Constructs new boolean ctrl item.

**Return** new boolean ctrl item or NULL upon memory allocation failure

### Parameters

- `value`: The value to use

`cbor_item_t *cbor_build_ctrl (uint8_t value)`

Constructs a ctrl item.

**Return** new ctrl item or NULL upon memory allocation failure

### Parameters

- `value`: the value to use

`cbor_item_t *cbor_build_float2 (float value)`

Constructs a new float.

**Return** new float

### Parameters

- `value`: the value to use

`cbor_item_t *cbor_build_float4 (float value)`

Constructs a new float.

**Return** new float or NULL upon memory allocation failure

### Parameters

- `value`: the value to use

`cbor_item_t *cbor_build_float8 (double value)`

Constructs a new float.

**Return** new float or NULL upon memory allocation failure

### Parameters

- `value`: the value to use

## Manipulating existing items

`void cbor_set_ctrl (cbor_item_t *item, uint8_t value)`

Assign a control value.

**Warning:** It is possible to produce an invalid CBOR value by assigning a invalid value using this mechanism. Please consult the standard before use.

### Parameters

- item[borrow]: A ctrl item
- value: The simple value to assign. Please consult the standard for allowed values

`void cbor_set_bool (cbor_item_t *item, bool value)`

Assign a boolean value to a boolean ctrl item.

#### Parameters

- item[borrow]: A ctrl item
- value: The simple value to assign.

`void cbor_set_float2 (cbor_item_t *item, float value)`

Assigns a float value.

#### Parameters

- item[borrow]: A half precision float
- value: The value to assign

`void cbor_set_float4 (cbor_item_t *item, float value)`

Assigns a float value.

#### Parameters

- item[borrow]: A single precision float
- value: The value to assign

`void cbor_set_float8 (cbor_item_t *item, double value)`

Assigns a float value.

#### Parameters

- item[borrow]: A double precision float
- value: The value to assign

### Half floats

CBOR supports two bytes wide (“half-precision”) floats which are not supported by the C language. *libcbor* represents them using `float <https://en.cppreference.com/w/c/language/type>` values throughout the API, which has important implications when manipulating these values.

In particular, if a user uses some of the manipulation APIs (e.g. `cbor_set_float2()`, `cbor_new_float2()`) to introduce a value that doesn’t have an exact half-float representation, the encoding semantics are given by `cbor_encode_half()` as follows:

`size_t cbor_encode_half (float, unsigned char *, size_t)`

Encodes a half-precision float.

Since there is no native representation or semantics for half floats in the language, we use single-precision floats, as every value that can be expressed as a half-float can also be expressed as a float.

This however means that not all floats passed to this function can be unambiguously encoded. The behavior is as follows:

- Infinity, NaN are preserved

- Zero is preserved
- Denormalized numbers keep their sign bit and 10 most significant bit of the significand
- All other numbers
  - If the logical value of the exponent is < -24, the output is zero
  - If the logical value of the exponent is between -23 and -14, the output is cut off to represent the ‘magnitude’ of the input, by which we mean  $(-1)^{\text{signbit}} \times 1.0e\{\text{exponent}\}$ . The value in the significand is lost.
  - In all other cases, the sign bit, the exponent, and 10 most significant bits of the significand are kept

**Return** number of bytes written

#### Parameters

- `value`:
- `buffer`: Target buffer
- `buffer_size`: Available space in the buffer

## 2.4 Streaming & indefinite items

CBOR *strings*, *byte strings*, *arrays*, and *maps* can be encoded as *indefinite*, meaning their length or size is not specified. Instead, they are divided into *chunks* (*strings*, *byte strings*), or explicitly terminated (*arrays*, *maps*).

This is one of the most important (and due to poor implementations, underutilized) features of CBOR. It enables low-overhead streaming just about anywhere without dealing with channels or pub/sub mechanism. It is, however, important to recognize that CBOR streaming is not a substitute for Websockets<sup>1</sup> and similar technologies.

### 2.4.1 Decoding

Another way to decode data using libcbor is to specify a callbacks that will be invoked when upon finding certain items in the input. This API is provided by

```
struct cbor_decoder_result cbor_stream_decode(cbor_data buffer, size_t buffer_size, const
                                              struct cbor_callbacks *callbacks, void *context)
```

Stateless decoder.

Will try parsing the `buffer` and will invoke the appropriate callback on success. Decodes one item at a time. No memory allocations occur.

#### Parameters

- `buffer`: Input buffer
- `buffer_size`: Length of the buffer
- `callbacks`: The callback bundle
- `context`: An arbitrary pointer to allow for maintaining context.

Usage example: [https://github.com/PJK/libcbor/blob/master/examples/streaming\\_parser.c](https://github.com/PJK/libcbor/blob/master/examples/streaming_parser.c)

The callbacks are defined by

---

<sup>1</sup> RFC 6455

**struct cbor\_callbacks**

Callback bundle passed to the decoder.

**Public Members**

*cbor\_int8\_callback* **uint8**

Unsigned int.

*cbor\_int16\_callback* **uint16**

Unsigned int.

*cbor\_int32\_callback* **uint32**

Unsigned int.

*cbor\_int64\_callback* **uint64**

Unsigned int.

*cbor\_int64\_callback* **negint64**

Negative int.

*cbor\_int32\_callback* **negint32**

Negative int.

*cbor\_int16\_callback* **negint16**

Negative int.

*cbor\_int8\_callback* **negint8**

Negative int.

*cbor\_simple\_callback* **byte\_string\_start**

Definite byte string.

*cbor\_string\_callback* **byte\_string**

Indefinite byte string start.

*cbor\_string\_callback* **string**

Definite string.

*cbor\_simple\_callback* **string\_start**

Indefinite string start.

*cbor\_simple\_callback* **indef\_array\_start**

Definite array.

*cbor\_collection\_callback* **array\_start**

Indefinite array.

*cbor\_simple\_callback* **indef\_map\_start**

Definite map.

*cbor\_collection\_callback* **map\_start**

Indefinite map.

*cbor\_int64\_callback* **tag**

Tags.

*cbor\_float\_callback* **float2**

Half float.

*cbor\_float\_callback* **float4**

Single float.

*cbor\_double\_callback* **float8**

Double float.

*cbor\_simple\_callback* **undefined**

Undef.

*cbor\_simple\_callback* **null**

Null.

*cbor\_bool\_callback* **boolean**

Bool.

*cbor\_simple\_callback* **indef\_break**

Indefinite item break.

When building custom sets of callbacks, feel free to start from

**const struct cbor\_callbacks cbor\_empty\_callbacks**

Dummy callback bundle - does nothing.

## Related structures

**enum cbor\_decoder\_status**

Streaming decoder result - status.

*Values:*

**CBOR\_DECODER\_FINISHED**

Decoding finished successfully (a callback has been invoked)

Note that this does *not* mean that the buffer has been fully decoded; there may still be unread bytes for which no callback has been involved.

**CBOR\_DECODER\_NEDATA**

Not enough data to invoke a callback.

**CBOR\_DECODER\_ERROR**

Bad data (reserved MTB, malformed value, etc.)

**struct cbor\_decoder\_result**

Streaming decoder result.

## Public Members

**size\_t read**

Input bytes read/consumed.

If this is less than the size of input buffer, the client will likely resume parsing starting at the next byte (e.g. `buffer + result.read`).

Set to 0 if the *status* is not **CBOR\_DECODER\_FINISHED**.

*cbor\_decoder\_status* **status**

The decoding status.

**size\_t required**

Number of bytes in the input buffer needed to resume parsing.

Set to 0 unless the result status is **CBOR\_DECODER\_NEDATA**. If it is, then:

- If at least one byte was passed, *required* will be set to the minimum number of bytes needed to invoke a decoded callback on the current prefix.

For example: Attempting to decode a 1B buffer containing 0x19 will set *required* to 3 as 0x19 signals a 2B integer item, so we need at least 3B to continue (the 0x19 MTB byte and two bytes of data needed to invoke *cbor\_callbacks.uint16*).

- If there was no data at all, *read* will always be set to 1

## Callback types definition

**typedef void (\*cbor\_int8\_callback)(void \*, uint8\_t)**

Callback prototype.

**typedef void (\*cbor\_int16\_callback)(void \*, uint16\_t)**

Callback prototype.

**typedef void (\*cbor\_int32\_callback)(void \*, uint32\_t)**

Callback prototype.

**typedef void (\*cbor\_int64\_callback)(void \*, uint64\_t)**

Callback prototype.

**typedef void (\*cbor\_simple\_callback)(void \*)**

Callback prototype.

**typedef void (\*cbor\_string\_callback)(void \*, cbor\_data, size\_t)**

Callback prototype.

**typedef void (\*cbor\_collection\_callback)(void \*, size\_t)**

Callback prototype.

**typedef void (\*cbor\_float\_callback)(void \*, float)**

Callback prototype.

**typedef void (\*cbor\_double\_callback)(void \*, double)**

Callback prototype.

**typedef void (\*cbor\_bool\_callback)(void \*, bool)**

Callback prototype.

## 2.4.2 Encoding

TODO

## 2.5 Tests

### 2.5.1 Unit tests

There is a comprehensive test suite employing [CMocka](#). You can run all of them using `ctest` in the build directory. Individual tests are themselves runnable. Please refer to [CTest](#) documentation for detailed information on how to specify particular subset of tests.

## 2.5.2 Testing for memory leaks

Every release is tested for memory correctness. You can run these tests by passing the `-T memcheck` flag to `ctest`.<sup>1</sup>

## 2.5.3 Code coverage

Every release is inspected using [GCOV/LCOV](#). Platform-independent code should be fully covered by the test suite. Simply run

```
make coverage
```

or alternatively run `lcov` by hand using

```
lcov --capture --directory . --output-file coverage.info  
genhtml coverage.info --output-directory out
```

## 2.5.4 Fuzz testing

Every release is tested using a fuzz test. In this test, a huge buffer filled with random data is passed to the decoder. We require that it either succeeds or fail with a sensible error, without leaking any memory. This is intended to simulate real-world situations where data received from the network are CBOR-decoded before any further processing.

## 2.6 RFC conformance

*libcbor* is, generally speaking, very faithful implementation of [RFC 7049](#). There are, however, some limitations imposed by technical constraints.

### 2.6.1 Bytestring length

There is no explicit limitation of indefinite length byte strings.<sup>1</sup> *libcbor* will not handle byte strings with more chunks than the maximum value of `size_t`. On any sane platform, such string would not fit in the memory anyway. It is, however, possible to process arbitrarily long strings and byte strings using the streaming decoder.

### 2.6.2 “Half-precision” IEEE 754 floats

As of C99 and even C11, there is no standard implementation for 2 bytes floats. *libcbor* packs them as a *float* <https://en.cppreference.com/w/c/language/type>. When encoding, *libcbor* selects the appropriate wire representation based on metadata and the actual value. This applies both to canonical and normal mode.

For more information on half-float serialization, please refer to the section on [\*Half floats\*](#).

<sup>1</sup> Project should be configured with `-DCMAKE_BUILD_TYPE=Debug` to obtain meaningful description of location of the leak. You might also need `--dSYMutil=yes` on OS X.

<sup>1</sup> <http://tools.ietf.org/html/rfc7049#section-2.2.2>

## 2.7 Internal mechanics

Internal workings of *libcbor* are mostly derived from the specification. The purpose of this document is to describe technical choices made during design & implementation and to explicate the reasoning behind those choices.

### 2.7.1 Terminology

MTB	Major Type Byte	<a href="http://tools.ietf.org/html/rfc7049#section-2.1">http://tools.ietf.org/html/rfc7049#section-2.1</a>
DST	Dynamically Sized Type	Type whose storage requirements cannot be determined during compilation (originated in the Rust community)

### 2.7.2 Conventions

API symbols start with `cbor_` or `CBOR_` prefix, internal symbols have `_cbor_` or `_CBOR_` prefix.

### 2.7.3 Inspiration & related projects

Most of the API is largely modelled after existing JSON libraries, including

- Jansson
- json-c
- Gnome's JsonGlib

and also borrowing from

- msgpack-c
- Google Protocol Buffers.

### 2.7.4 General notes on the API design

The API design has two main driving principles:

1. Let the client manage the memory as much as possible
2. Behave exactly as specified by the standard

Combining these two principles in practice turns out to be quite difficult. Indefinite-length strings, arrays, and maps require client to handle every fixed-size chunk explicitly in order to

- ensure the client never runs out of memory due to *libcbor*
- use `realloc()` sparsely and predictably<sup>1</sup>
  - provide strong guarantees about its usage (to prevent latency spikes)
  - provide APIs to avoid `realloc()` altogether
- allow proper handling of (streamed) data bigger than available memory

<sup>1</sup> Reasonable handling of DSTs requires reallocation if the API is to remain sane.

## 2.7.5 Coding style

This code loosely follows the [Linux kernel coding style](#). Tabs are tabs, and they are 4 characters wide.

## 2.7.6 Memory layout

CBOR is very dynamic in the sense that it contains many data elements of variable length, sometimes even indefinite length. This section describes internal representation of all CBOR data types.

Generally speaking, data items consist of three parts:

- a generic *handle*,
  - the associated *metadata*,
  - and the actual data

```
type cbor_item_t
```

Represents the item. Used as an opaque type

*char\_type* **type**

Type discrim

`t.refcount`

Reference counter. Used by *cbor\_*

on *cbor\_item\_metadata* **metadata**

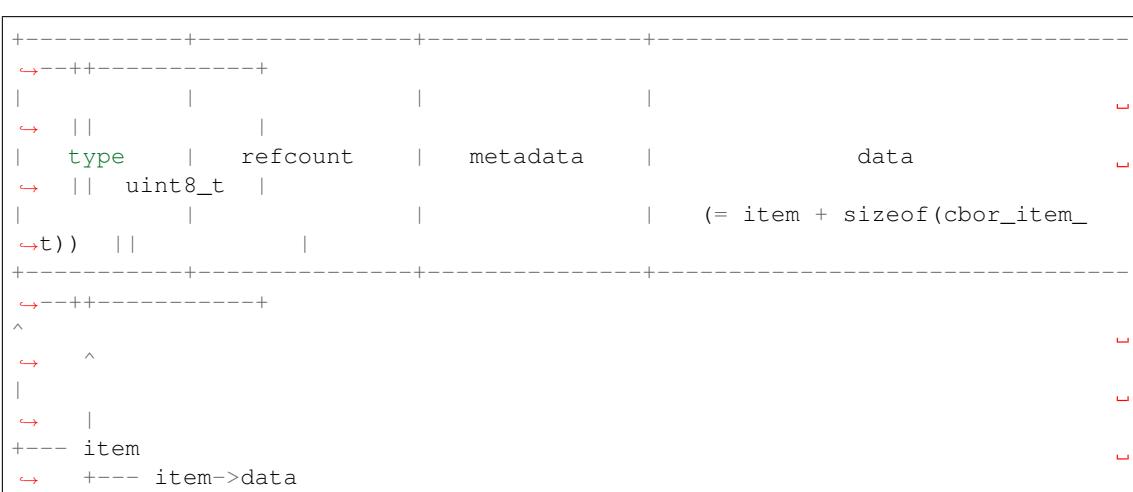

## Union discrimination

**gned char \*data**  
Contains pointer to the actual data. Small, fixed size items (*Types 0 & 1 – Positive and negative integers,*

### Type 6 Semantic tags, Type 7

Journal of Oral Rehabilitation 2009; 36: 103–109

then the memory is laid out as follows:

Dynamically sized types ([Type 2 – Byte strings](#), [Type 3 – UTF-8 strings](#), [Type 4 – Arrays](#), [Type 5 – Maps](#)) may store handle and data in separate locations. This enables creating large items (e.g [byte strings](#)) without `realloc()` or copying large blocks of memory. One simply attaches the correct pointer to the handle.

**type cbor\_item\_metadata**

Union type of the following members, based on the item type:

**struct \_cbor\_int\_metadata int\_metadata**

Used both by both *Types 0 & 1 – Positive and negative integers*

**struct \_cbor\_bytestring\_metadata bytestring\_metadata****struct \_cbor\_string\_metadata string\_metadata****struct \_cbor\_array\_metadata array\_metadata****struct \_cbor\_map\_metadata map\_metadata****struct \_cbor\_tag\_metadata tag\_metadata****struct \_cbor\_float\_ctrl\_metadata float\_ctrl\_metadata**

## 2.7.7 Decoding

As outlined in [API](#), there decoding is based on the streaming decoder. Essentially, the decoder is a custom set of callbacks for the streaming decoder.

## 2.8 Changelog

### 2.8.1 Next

### 2.8.2 0.8.0 (2020-09-20)

- BUILD BREAKING: Use `BUILD_SHARED_LIBS` to determine how to build libraries (fixed Windows linkage) [[#148]](<https://github.com/PJK/libcbor/pull/148>) (by [intelligide@]([<https://github.com/intelligide>]))
- BREAKING: Fix `cbor_tag_item` not increasing the reference count on the tagged item reference it returns [[Fixes #109]](<https://github.com/PJK/libcbor/issues/109>) (discovered by [JohnGilmour]([<https://github.com/JohnGilmour>])) - If you have previously relied on the broken behavior, you can use `cbor_move` to emulate as long as the returned handle is an “rvalue”
- BREAKING: [**`CBOR_DECODER_EBUFFER`** removed from `cbor_decoder_status`] (<https://github.com/PJK/libcbor/pull/156>)
  - `cbor_stream_decode` will set `CBOR_DECODER_NEDATA` instead if the input buffer is empty
- [Fix `cbor_stream_decode`] (<https://github.com/PJK/libcbor/pull/156>) to set `cbor_decoder_result.required` to the minimum number of input bytes necessary to receive the next callback (as long as at least one byte was passed) (discovered by [woefulwabbit]([<https://github.com/woefulwabbit>]))
- Fixed several minor manpage issues [[#159]](<https://github.com/PJK/libcbor/pull/159>) (discovered by [kloczek@]([<https://github.com/kloczek>]))

### 2.8.3 0.7.0 (2020-04-25)

- Fix bad encoding of NaN half-floats [[Fixes #53]](<https://github.com/PJK/libcbor/issues/53>) (discovered by [BSipos-RKF])
  - **Warning:** Previous versions encoded NaNs as `0x9e700` instead of `0x97e00`; if you rely on the broken behavior, this will be a breaking change
- Fix potentially bad encoding of negative half-float with exponent < -14 [[Fixes #112]](<https://github.com/PJK/libcbor/issues/112>) (discovered by [yami36](<https://github.com/yami36>))
- **BREAKING: Improved bool support** [[Fixes #63]](<https://github.com/PJK/libcbor/issues/63>)
  - Rename `cbor_ctrl_is_bool` to `cbor_get_bool` and fix the behavior
  - Add `cbor_set_bool`
- Fix `memory_allocation_test` breaking the build without `CBOR_CUSTOM_ALLOC` [[Fixes #128]](<https://github.com/PJK/libcbor/issues/128>) (by [panlinux](<https://github.com/panlinux>))
- [Fix a potential build issue where cJSON includes may be misconfigured] (<https://github.com/PJK/libcbor/pull/132>)
- **Breaking: [Add a limit on the size of the decoding context stack]** (<https://github.com/PJK/libcbor/pull/138>) (by [James-ZH])
  - If your usecase requires parsing very deeply nested structures, you might need to increase the default 2k limit via `CBOR_MAX_STACK_SIZE`
- **Enable LTO/IPO based on [CheckIPOSupported]** (<https://cmake.org/cmake/help/latest/module/CheckIPOSupported.html>)
  - If you rely on LTO being enabled and use CMake version older than 3.9, you will need to re-enable it manually or upgrade your CMake

### 2.8.4 0.6.1 (2020-03-26)

- [Fix bad shared library version number] (<https://github.com/PJK/libcbor/pull/131>)
  - **Warning:** Shared library built from the 0.6.0 release is erroneously marked as version “0.6.0”, which makes it incompatible with future releases *including the v0.6.X line* even though they may be compatible API/ABI-wise. Refer to the documentation for the new SO versioning scheme.

### 2.8.5 0.6.0 (2020-03-15)

- **Correctly set .so version** [[Fixes #52]](<https://github.com/PJK/libcbor/issues/52>).
  - **Warning:** All previous releases will be identified as 0.0 by the linker.
- Fix & prevent heap overflow error in example code [[#74]](<https://github.com/PJK/libcbor/pull/74>) [[#76]](<https://github.com/PJK/libcbor/pull/76>) (by @nevun)
- Correctly set OSX dynamic library version [[Fixes #75]](<https://github.com/PJK/libcbor/issues/75>)
- [Fix misplaced 0xFF bytes in maps possibly causing memory corruption] (<https://github.com/PJK/libcbor/pull/82>)
- **BREAKING: Fix handling & cleanup of failed memory allocation in constructor and builder helper functions** [[Fixes #84]](<https://github.com/PJK/libcbor/issues/84>) - All `cbor_new_*` and `cbor_build_*` functions will now explicitly return NULL when memory allocation fails - It is up to the client to handle such cases

- Globally enforced code style [[Fixes #83]](<https://github.com/PJK/libcbor/issues/83>)
- Fix issue possible memory corruption bug on repeated cbor\_(byte)string\_add\_chunk calls with intermittently failing realloc calls
- Fix possibly misaligned reads and writes when endian.h is uses or when running on a big-endian machine [[Fixes #99]](<https://github.com/PJK/libcbor/issues/99>), [#100] (<https://github.com/PJK/libcbor/issues/100>)
- [Improved CI setup with Travis-native arm64 support] (<https://github.com/PJK/libcbor/pull/116>)
- [Docs migrated to Sphinx 2.4 and Python3] (<https://github.com/PJK/libcbor/pull/117>)

## 2.8.6 0.5.0 (2017-02-06)

- Remove cmocka from the subtree (always rely on system or user-provided version)
- Windows CI
- Only build tests if explicitly enabled (-DWITH\_TESTS=ON)
- Fixed static header declarations (by cedric-d)
- Improved documentation (by Michael Richardson)
- Improved *examples/readfile.c*
- Reworked (re)allocation to handle huge inputs and overflows in size\_t [[Fixes #16]](<https://github.com/PJK/libcbor/issues/16>)
- Improvements to C++ linkage (corrected *cbor\_empty\_callbacks*, fixed *restrict* pointers) (by Dennis Bijwaard)
- Fixed Linux installation directory depending on architecture [[Fixes #34]](<https://github.com/PJK/libcbor/issues/34>) (by jvymazal)
- Improved 32-bit support [[Fixes #35]](<https://github.com/PJK/libcbor/issues/35>)
- Fixed MSVC compatibility [[Fixes #31]](<https://github.com/PJK/libcbor/issues/31>)
- Fixed and improved half-float encoding [[Fixes #5]](<https://github.com/PJK/libcbor/issues/5>), [#11] (<https://github.com/PJK/libcbor/issues/11>)

## 2.8.7 0.4.0 (2015-12-25)

Breaks build & header compatibility due to:

- Improved build configuration and feature check macros
- Endianess configuration fixes (by Erwin Kroon and David Grigsby)
- pkg-config compatibility (by Vincent Bernat)
- enable use of versioned SONAME (by Vincent Bernat)
- better fuzzer (wasn't random until now, oops)

## **2.8.8 0.3.1 (2015-05-21)**

- documentation and comments improvements, mostly for the API reference

## **2.8.9 0.3.0 (2015-05-21)**

- Fixes, polishing, niceties across the code base
- Updated examples
- *cbor\_copy*
- *cbor\_build\_negint8*, 16, 32, 64, matching asserts
- *cbor\_build\_stringn*
- *cbor\_build\_tag*
- *cbor\_build\_float2*, ...

## **2.8.10 0.2.1 (2015-05-17)**

- C99 support

## **2.8.11 0.2.0 (2015-05-17)**

- *cbor\_ctrl\_bool -> cbor\_ctrl\_is\_bool*
- Added *cbor\_array\_allocated* & map equivalent
- Overhauled endianess conversion - ARM now works as expected
- ‘sort.c’ example added
- Significantly improved and doxyfied documentation

## **2.8.12 0.1.0 (2015-05-06)**

The initial release, yay!

## **2.9 Development**

### **2.9.1 Vision and principles**

Consistency and coherence are one of the key characteristics of good software. While the reality is never black and white, it is important libcbor contributors are working towards the same high-level goal. This document attempts to set out the basic principles of libcbor and the rationale behind them. If you are contributing to libcbor or looking to evaluate whether libcbor is the right choice for your project, it might be worthwhile to skim through the section below.

## Mission statement

*libcbor* is the compact, full-featured, and safe CBOR library that works everywhere.

### Goals

#### RFC-conformance and full feature support

Anything the standard allows, libcbor can do.

**Why?** Because conformance and interoperability is the point of defining standards. Clients expect the support to be feature-complete and there is no significant complexity reduction that can be achieved by slightly cutting corners, which means that the incremental cost of full RFC support is comparatively small over “almost-conformance” seen in many alternatives.

#### Safety

Untrusted bytes from the network are the typical input.

**Why?** Because it is the client expectation. Vast majority of security vulnerabilities are violations of contracts – in other words, bugs – anyway.

#### Self-containment

libcbor has no runtime dependencies.

**Why?** Because any constraint imposed on libcbor has to be enforced transitively, which is difficult and leads to incompatibilities and distribution issues, especially in IoT applications.

#### Portability

If you can compile C for it, libcbor will work there.

**Why?** Lowest-common-denominator solution for system-level and IoT software was the original niche of libcbor. Users who rely on libcbor expect future updates to work on their target platform.

#### Stable and predictable API

libcbor will not break without a warning.

**Why?** Industry-standard versioning is a basic requirement for production-quality software. This is especially relevant in IoT environments where updates may be costly.

## Performance

libcbor is fast and resource-efficient by design

**Why?** Because the main maintainer is an avid hater of slow bloated software. Who wouldn't want more bang per their electricity buck?

## Non-goals

- Convenience – libcbor only provides the minimum surface to make it usable
- FFI/SWIG/interop support – libcbor is primarily a C library for C clients
- One-off usecases support – although there are primitives to reuse, the basic assumption is that most clients want most of CBOR features

## 2.9.2 Development dependencies

- [CMocka](#) (testing)
- Python and [pip](#) (Sphinx platform)
- [Doxygen](#)
- [Sphinx](#) (documentation)
- There are some [Ruby](#) scripts in misc
- [Valgrind](#) (memory correctness & profiling)
- [GCOV/LCOV](#) (test coverage)
- *clang-format*

## Installing sphinx

```
pip install sphinx
pip install sphinx_rtd_theme
pip install breathe
pip install https://github.com/lepture/python-livereload/archive/master.zip
pip install sphinx-autobuild
```

Further instructions on configuring advanced features can be found at <http://read-the-docs.readthedocs.org/en/latest/install.html>.

## Live preview of docs

```
cd doc
make livehtml
```

## Set up git hooks

A catch-all git hook that runs clang-format and automatically refreshes the GH pages contents located in `docs` can be symlinked:

```
ln -sf $(pwd)/misc/hooks/pre-commit .git/hooks
```

## Testing and code coverage

Please refer to *Tests*
