libcbor Documentation

Release 0.2.0

Pavel Kalvoda

May 18, 2015

Contents

Documentation for version 0.2.0, updated on May 18, 2015.

CHAPTER 1

Overview

libcbor is a C library for parsing and generating CBOR, the general-purpose schema-less binary data format.

Main features

- Complete RFC conformance [1]
- Robust C11 implementation
- Layered architecture offers both control and convenience
- Flexible memory management
- Proper handling of UTF-8
- No shared global state - threading friendly
- Full support for streams & incremental processing
- Extensive documentation and test suite
- No runtime dependencies, small footprint

[1] RFC conformance

CHAPTER 2

Contents

2.1 Getting started

Pre-built Linux packages are distributed from the libcbor website. For other platforms, you will need to compile it from source.

2.1.1 Building & installing libcbor

Prerequisites:

- C11 compiler
- CMake 2.8 or newer (might also be called `cmakesetup`, `cmake-gui` or `ccmake` depending on the installed version and system)
- C build system CMake can target (make, Apple Xcode, MinGW, ...)

Note: As of May 2015, the 2015 release candidate of Visual Studio does not support C11. While CMake will be happy to generate a VS solution that you can play with, libcbor currently cannot be compiled using the MSVC toolchain. Both ICC and GCC under Cygwin will work.

Configuration options

A handful of configuration flags can be passed to *cmake*. The following table lists libcbor compile-time directives and several important generic flags.

Option	Meaning	Default	Possible values
`CMAKE_C_COMPILER`	C compiler to use	`cc`	`gcc`, `clang`, `clang-3.5`, ...
`CMAKE_INSTALL_PREFIX`	Installation prefix	System-dependent	`/usr/local/lib`, ...
`CUSTOM_ALLOC`	Allow custom `malloc`?	`ON`	`ON`, `OFF`
`HUGE_FUZZ`	Fuzz test with 8GB of data	`OFF`	`ON`, `OFF`
`SANE_MALLOC`	Assume `malloc` will refuse unreasonable allocations	`OFF`	`ON`, `OFF`
`COVERAGE`	Generate test coverage instrumentation	`OFF`	`ON`, `OFF`
`PRETTY_PRINTER`	Include a pretty-printer implementation	`ON`	`ON`, `OFF`
`BUFFER_GROWTH`	Buffer growth factor	`2`	`>1`

If you want to pass other custom configuration options, please refer to http://www.cmake.org/Wiki/CMake_Useful_Variables.

Building using make

```
# Assuming you are in the directory where you want to build
cmake -DCMAKE_BUILD_TYPE=Release path_to_libcbor_dir
make cbor
```

Both the shared (`libcbor.so`) and the static (`libcbor.a`) libraries should now be in the `src` subdirectory.

In order to install the libcbor headers and libraries, the usual

```
make install
```

is what your're looking for. Root permissions are required on most systems.

Portability

libcbor is highly portable and works on both little- and big-endian systems regardless of the operating system. After building on an exotic platform, you might wish to verify the result by running the test suite. If you encounter any problems, please report them to the issue tracker.

libcbor is known to successfully work on ARM Android devices. Cross-compilation is possible with `arm-linux-gnueabi-gcc`.

2.1.2 Linking with libcbor

If you include and linker paths include the directories to which libcbor has been installed, compiling programs that uses libcbor requires no extra considerations.

You can verify that everything has been set up properly by creating a file with the following contents

```
#include <cbor.h>
#include <stdio.h>

int main(int argc, char * argv[])
{
    printf("Hello from libcbor %s\n", CBOR_VERSION);
}
```

and compiling it

```
cc hello_cbor.c -lcbor -o hello_cbor
```

2.1.3 Troubleshooting

cbor.h not found: The headers directory is probably not in your include path. First, verify the installation location by checking the installation log. If you used make, it will look something like

```
...
-- Installing: /usr/local/include/cbor
-- Installing: /usr/local/include/cbor/callbacks.h
-- Installing: /usr/local/include/cbor/encoding.h
...
```

Make sure that `CMAKE_INSTALL_PREFIX` (if you provided it) was correct. Including the path path during compilation should suffice, e.g.:

```
cc -I/usr/local/include hello_cbor.c -lcbor -o hello_cbor
```

cannot find -lcbor during linking: Most likely the same problem as before. Include the installation directory in the linker shared path using `-R`, e.g.:

```
cc -Wl,-rpath,/usr/local/lib -lcbor -o hello_cbor
```

shared library missing during execution: Verify the linkage using `ldd`, `otool`, or similar and adjust the compilation directives accordingly:

```
  ldd hello_cbor
    linux-vdso.so.1 =>  (0x00007ffe85585000)
    libcbor.so => /usr/local/lib/libcbor.so (0x00007f9af69da000)
    libc.so.6 => /lib/x86_64-linux-gnu/libc.so.6 (0x00007f9af65eb000)
    /lib64/ld-linux-x86-64.so.2 (0x00007f9af6be9000)
```

compilation failed: If your compiler supports C11 yet the compilation has failed, please report the issue to the issue tracker.

2.2 Usage & preliminaries

2.2.1 Version information

libcbor exports its version using three self-explanatory macros:

- `CBOR_MAJOR_VERSION`
- `CBOR_MINOR_VERSION`
- `CBOR_PATCH_VERSION`

The `CBOR_VERSION` is a string concatenating these three identifiers into one (e.g. `0.2.0`).

In order to simplify version comparisons, the version is also exported as

```
#define CBOR_HEX_VERSION ((CBOR_MAJOR_VERSION << 16) | (CBOR_MINOR_VERSION << 8) | CBOR_PATCH_VERSIO
```

Since macros are difficult to work with through FFIs, the same information is also available through three `uint8_t` constants, namely

- `cbor_major_version`
- `cbor_minor_version`
- `cbor_patch_version`

2.2.2 Headers to include

The `cbor.h` header includes all the symbols. If, for any reason, you don't want to include all the exported symbols, feel free to use just some of the `cbor/*.h` headers:

- `cbor/arrays.h` - Type 4 – Arrays
- `cbor/bytestrings.h` - Type 2 – Byte strings
- `cbor/callbacks.h` - Callbacks used for Decoding
- `cbor/common.h` - Common utilities - always transitively included
- `cbor/data.h` - Data types definitions - always transitively included
- `cbor/encoding.h` - Streaming encoders for Encoding
- `cbor/floats_ctrls.h` - Type 7 – Floats & control tokens

- `cbor/ints.h` - Types 0 & 1 – Positive and negative integers
- `cbor/maps.h` - Type 5 – Maps
- `cbor/serialization.h` - High level serialization such as *`cbor_serialize()`*
- `cbor/streaming.h` - Home of *`cbor_stream_decode()`*
- `cbor/strings.h` - Type 3 – UTF-8 strings
- `cbor/tags.h` - Type 6 – Semantic tags

2.2.3 Using libcbor

If you want to get more familiar with CBOR, we recommend the cbor.io website. Once you get the grasp of what is it CBOR does, the examples (located in the `examples` directory) should give you a good feel of the API. The API documentation should then provide with all the information you may need.

Creating and serializing items

```
#include "cbor.h"
#include <stdio.h>

int main(int argc, char * argv[])
{
    /* Preallocate the map structure */
    cbor_item_t * root = cbor_new_definite_map(2);
    /* Add the content */
    cbor_map_add(root, (struct cbor_pair) {
        .key = cbor_move(cbor_build_string("Is CBOR awesome?")),
        .value = cbor_move(cbor_build_bool(true))
    });
    cbor_map_add(root, (struct cbor_pair) {
        .key = cbor_move(cbor_build_uint8(42)),
        .value = cbor_move(cbor_build_string("Is the answer"))
    });
    /* Output: `length` bytes of data in the `buffer` */
    unsigned char * buffer;
    size_t buffer_size, length = cbor_serialize_alloc(root, &buffer, &buffer_size);

    fwrite(buffer, 1, length, stdout);
    free(buffer);

    fflush(stdout);
    cbor_decref(&root);
}
```

Reading serialized data

```
#include "cbor.h"
#include <stdio.h>

/*
 * Reads data from a file. Example usage:
 * $ ./examples/readfile examples/data/nested_array.cbor
 */

int main(int argc, char * argv[])
{
    FILE * f = fopen(argv[1], "rb");
```

```
    fseek(f, 0, SEEK_END);
    size_t length = (size_t)ftell(f);
    fseek(f, 0, SEEK_SET);
    unsigned char * buffer = malloc(length);
    fread(buffer, length, 1, f);

    /* Assuming `buffer` contains `info.st_size` bytes of input data */
    struct cbor_load_result result;
    cbor_item_t * item = cbor_load(buffer, length, &result);
    /* Pretty-print the result */
    cbor_describe(item, stdout);
    fflush(stdout);
    /* Deallocate the result */
    cbor_decref(&item);

    fclose(f);
}
```

Using the streaming parser

```
#include "cbor.h"
#include <stdio.h>
#include <string.h>

/*
 * Illustrates how one might skim through a map (which is assumed to have
 * string keys and values only), looking for the value of a specific key
 *
 * Use the examples/data/map.cbor input to test this.
 */

const char * key = "a secret key";
bool key_found = false;

void find_string(void * _ctx, cbor_data buffer, size_t len)
{
    if (key_found) {
        printf("Found the value: %*s\n", (int) len, buffer);
        key_found = false;
    } else if (len == strlen(key)) {
        key_found = (memcmp(key, buffer, len) == 0);
    }
}

int main(int argc, char * argv[])
{
    FILE * f = fopen(argv[1], "rb");
    fseek(f, 0, SEEK_END);
    size_t length = (size_t)ftell(f);
    fseek(f, 0, SEEK_SET);
    unsigned char * buffer = malloc(length);
    fread(buffer, length, 1, f);

    struct cbor_callbacks callbacks = cbor_empty_callbacks;
    struct cbor_decoder_result decode_result;
    size_t bytes_read = 0;
    callbacks.string = find_string;
    while (bytes_read < length) {
        decode_result = cbor_stream_decode(buffer + bytes_read,
```

```
                                            length - bytes_read,
                                            &callbacks, NULL);
        bytes_read += decode_result.read;
    }

    fclose(f);
}
```

2.3 API

The data API is centered around *cbor_item_t*, a generic handle for any CBOR item. There are functions to

- create items,
- set items' data,
- parse serialized data into items,
- manage, move, and links item together.

The single most important thing to keep in mind is: *cbor_item_t* **is an opaque type and should only be manipulated using the appropriate functions!** Think of it as an object.

The *libcbor* API closely follows the semantics outlined by CBOR standard. This part of the documentation provides a short overview of the CBOR constructs, as well as a general introduction to the *libcbor* API. Remaining reference can be found in the following files structured by data types.

The API is designed to allow both very tight control & flexibility and general convenience with sane defaults. [1] For example, client with very specific requirements (constrained environment, custom application protocol built on top of CBOR, etc.) may choose to take full control (and responsibility) of memory and data structures management by interacting directly with the decoder. Other clients might want to take control of specific aspects (streamed collections, hash maps storage), but leave other responsibilities to *libcbor*. More general clients might prefer to be abstracted away from all aforementioned details and only be presented complete data structures.

***libcbor* provides**

- stateless encoders and decoders
- encoding and decoding *drivers*, routines that coordinate encoding and decoding of complex structures
- data structures to represent and transform CBOR structures
- routines for building and manipulating these structures
- utilities for inspection and debugging

2.3.1 Types of items

Every *cbor_item_t* has a *cbor_type* associated with it - these constants correspond to the types specified by the CBOR standard:

enum cbor_type

Specifies the Major type of cbor_item_t.

Values:

CBOR_TYPE_UINT

0 - positive integers

[1] http://softwareengineering.vazexqi.com/files/pattern.html

CBOR_TYPE_NEGINT
1 - negative integers

CBOR_TYPE_BYTESTRING
2 - byte strings

CBOR_TYPE_STRING
3 - strings

CBOR_TYPE_ARRAY
4 - arrays

CBOR_TYPE_MAP
5 - maps

CBOR_TYPE_TAG
6 - tags

CBOR_TYPE_FLOAT_CTRL
7 - decimals and special values (true, false, nil, ...)

To find out the type of an item, one can use

cbor_type **cbor_typeof**(**const** *cbor_item_t* **item*)
Get the type of the item.

Return

The type

Parameters

- `item[borrow]` -

Please note the distinction between functions like *cbor_isa_uint()* and *cbor_is_int()*. The following functions work solely with the major type value.

Binary queries

Alternatively, there are functions to query each particular type.

Warning: Passing an invalid *cbor_item_t* reference to any of these functions results in undefined behavior.

bool **cbor_isa_uint**(**const** *cbor_item_t* **item*)
Does the item have the appropriate major type?

Return

Is the item an *CBOR_TYPE_UINT*?

Parameters

- `item[borrow]` - the item

bool **cbor_isa_negint**(**const** *cbor_item_t* **item*)
Does the item have the appropriate major type?

Return

Is the item a *CBOR_TYPE_NEGINT*?

Parameters

- `item[borrow]` - the item

bool **cbor_isa_bytestring**(**const** *cbor_item_t* *item)
Does the item have the appropriate major type?

Return

Is the item a *CBOR_TYPE_BYTESTRING*?

Parameters

- `item[borrow]` - the item

bool **cbor_isa_string**(**const** *cbor_item_t* *item)
Does the item have the appropriate major type?

Return

Is the item a *CBOR_TYPE_STRING*?

Parameters

- `item[borrow]` - the item

bool **cbor_isa_array**(**const** *cbor_item_t* *item)
Does the item have the appropriate major type?

Return

Is the item an *CBOR_TYPE_ARRAY*?

Parameters

- `item[borrow]` - the item

bool **cbor_isa_map**(**const** *cbor_item_t* *item)
Does the item have the appropriate major type?

Return

Is the item a *CBOR_TYPE_MAP*?

Parameters

- `item[borrow]` - the item

bool **cbor_isa_tag**(**const** *cbor_item_t* *item)
Does the item have the appropriate major type?

Return

Is the item a *CBOR_TYPE_TAG*?

Parameters

- `item[borrow]` - the item

bool **cbor_isa_float_ctrl**(**const** *cbor_item_t* *item)
Does the item have the appropriate major type?

Return

Is the item a *CBOR_TYPE_FLOAT_CTRL*?

Parameters

- `item[borrow]` - the item

Logical queries

These functions provide information about the item type from a more high-level perspective

bool **`cbor_is_int`**(**const** *cbor_item_t *item*)
Is the item an integer, either positive or negative?

Return

Is the item an integer, either positive or negative?

Parameters

- `item[borrow]` - the item

bool **`cbor_is_float`**(**const** *cbor_item_t *item*)
Is the item an a floating point number?

Return

Is the item a floating point number?

Parameters

- `item[borrow]` - the item

bool **`cbor_is_bool`**(**const** *cbor_item_t *item*)
Is the item an a boolean?

Return

Is the item a boolean?

Parameters

- `item[borrow]` - the item

bool **`cbor_is_null`**(**const** *cbor_item_t *item*)
Does this item represent `null`

> **Warning:** This is in no way related to the value of the pointer. Passing a null pointer will most likely result in a crash.

Return

Is the item (CBOR logical) null?

Parameters

- `item[borrow]` - the item

bool **cbor_is_undef**(**const** *cbor_item_t *item*)

Does this item represent `undefined`

> **Warning:** Care must be taken to distinguish nulls and undefined values in C.

Return

Is the item (CBOR logical) undefined?

Parameters

- `item[borrow]` - the item

2.3.2 Memory management and reference counting

Due to the nature of its domain *libcbor* will need to work with heap memory. The stateless decoder and encoder don't allocate any memory.

If you have specific requirements, you should consider rolling your own driver for the stateless API.

Using custom allocator

libcbor gives you with the ability to provide your own implementations of `malloc`, `realloc`, and `free`. This can be useful if you are using a custom allocator throughout your application, or if you want to implement custom policies (e.g. tighter restrictions on the amount of allocated memory).

In order to use this feature, *libcbor* has to be compiled with the `appropriate flags`. You can verify the configuration using the `CBOR_CUSTOM_ALLOC` macro. A simple usage might be as follows:

```
#ifdef CBOR_CUSTOM_ALLOC
    cbor_set_allocs(malloc, realloc, free);
#else
   #error "libcbor built with support for custom allocation is required"
#endif
```

void **cbor_set_allocs**(_cbor_malloc_t *custom_malloc*, _cbor_realloc_t *custom_realloc*, _cbor_free_t *custom_free*)

Sets the memory management routines to use.

Only available when CBOR_CUSTOM_ALLOC is defined

> **Warning:** This function modifies the global state and should therefore be used accordingly. Changing the memory handlers while allocated items exist will result in a `free`/`malloc` mismatch. This function is not thread safe with respect to both itself and all the other *libcbor* functions that work with the heap.

Note: *realloc* implementation must correctly support *NULL* reallocation

---

Parameters

- `custom_malloc` - malloc implementation
- `custom_realloc` - realloc implementation
- `custom_free` - free implementation

Reference counting

As CBOR items may require complex cleanups at the end of their lifetime, there is a reference counting mechanism in place. This also enables very simple GC when integrating *libcbor* into managed environment. Every item starts its life (by either explicit creation, or as a result of parsing) with reference count set to 1. When the refcount reaches zero, it will be destroyed.

Items containing nested items will be destroyed recursively - refcount of every nested item will be decreased by one.

The destruction is synchronous and renders any pointers to items with refcount zero invalid immediately after calling the *cbor_decref()*.

cbor_item_t ***cbor_incref** (*cbor_item_t *item*)
Increases the reference count by one.

No dependent items are affected.

Return

the input reference

Parameters

- `item[incref]` - item the item

void **cbor_decref** (*cbor_item_t **item*)
Decreases the reference count by one, deallocating the item if needed.

In case the item is deallocated, the reference count of any dependent items is adjusted accordingly in a recursive manner.

Parameters

- `item[take]` - the item. Set to `NULL` if deallocated

void **cbor_intermediate_decref** (*cbor_item_t *item*)
Decreases the reference count by one, deallocating the item if needed.

Convenience wrapper for *cbor_decref* when its set-to-null behavior is not needed

Parameters

- `item[take]` - the item

size_t **cbor_refcount** (**const** *cbor_item_t *item*)
Get the reference count.

> **Warning:** This does *not* account for transitive references.

Return

the reference count

Parameters

- `item[borrow]` - the item

cbor_item_t ***cbor_move**(*cbor_item_t* **item*)

Provide CPP-like move construct.

Decreases the reference count by one, but does not deallocate the item even if it reach zero. This is useful for passing intermediate values to functions that increase reference count, Should only be used with functions that `incref` their arguments.

Warning: If the item is moved without correctly increasing the reference count afterwards, the memory will be leaked.

Return

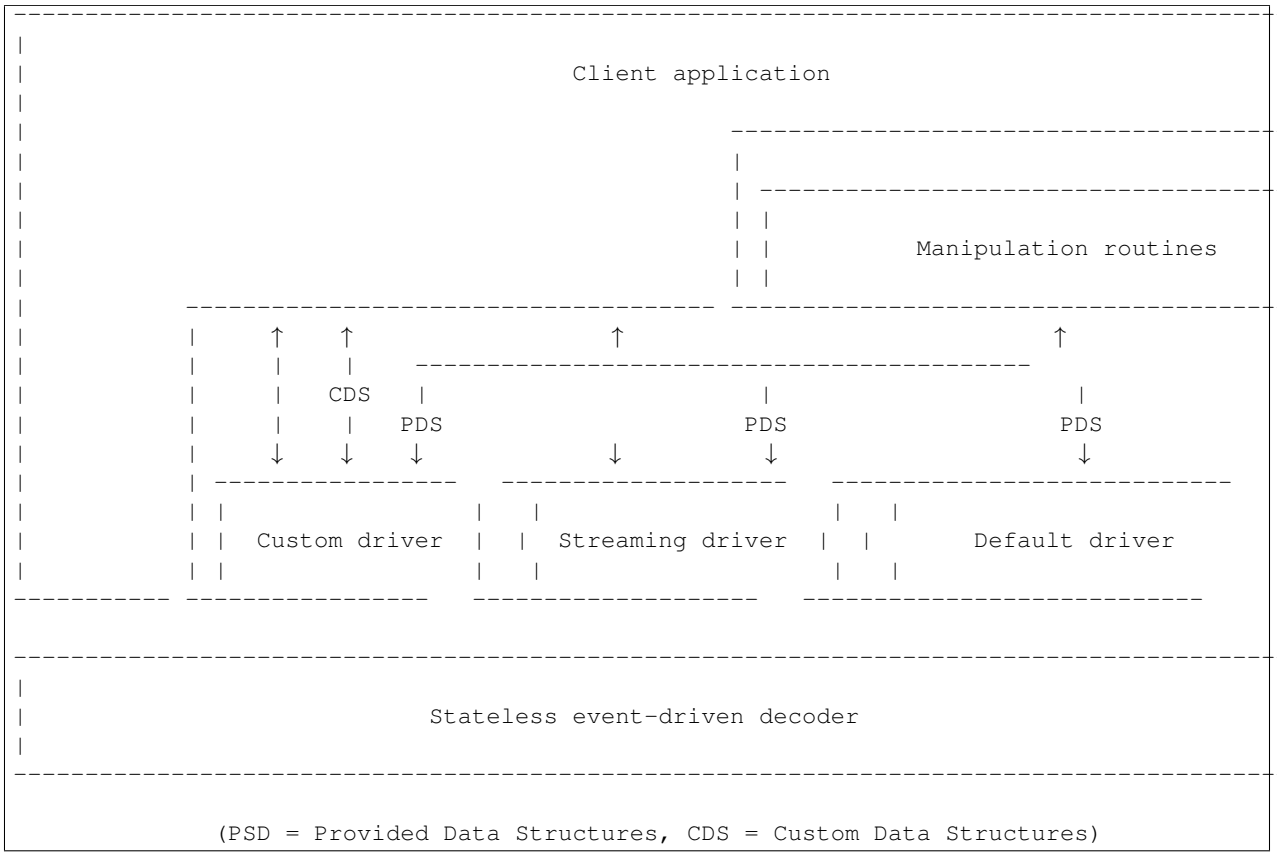
the item with reference count decreased by one

Parameters

- `item[take]` - the item

2.3.3 Decoding

The following diagram illustrates the relationship among different parts of libcbor from the decoding standpoint.



This section will deal with the API that is labeled as the "Default driver" in the diagram. That is, routines that decode complete libcbor data items

cbor_item_t ***cbor_load**(cbor_data *source*, size_t *source_size*, **struct** *cbor_load_result* **result*)

Loads data item from a buffer.

Return

new CBOR item or `NULL` on failure. In that case, `result` contains location and description of the error.

Parameters

- `source` - The buffer
- `source_size` -
- `result[out]` - Result indicator. *CBOR_ERR_NONE* on success

Associated data structures

enum `cbor_error_code`
Possible decoding errors.

Values:

`CBOR_ERR_NONE`

`CBOR_ERR_NOTENOUGHDATA`

`CBOR_ERR_NODATA`

`CBOR_ERR_MALFORMATED`

`CBOR_ERR_MEMERROR`
Memory error - item allocation failed.

Is it too big for your allocator?

`CBOR_ERR_SYNTAXERROR`
Stack parsing algorithm failed.

struct `cbor_load_result`
High-level decoding result.

Public Members

struct *cbor_error* **`error`**
Error indicator.

size_t **`read`**
Number of bytes read.

struct `cbor_error`
High-level decoding error.

Public Members

size_t **`position`**
Aproximate position.

cbor_error_code **`code`**
Description.

2.3.4 Encoding

The easiest way to encode data items is using the *cbor_serialize()* or *cbor_serialize_alloc()* functions:

size_t **cbor_serialize**(**const** *cbor_item_t* **item*, cbor_mutable_data *buffer*, size_t *buffer_size*)
Serialize the given item.

Return

Length of the result. 0 on failure.

Parameters

- `item[borrow]` - A data item
- `buffer` - Buffer to serialize to
- `buffer_size` - Size of the `buffer`

size_t **cbor_serialize_alloc**(**const** *cbor_item_t* **item*, cbor_mutable_data **buffer*, size_t **buffer_size*)
Serialize the given item, allocating buffers as needed.

> **Warning:** It is your responsibility to free the buffer using an appropriate `free` implementation.

Return

Length of the result. 0 on failure, in which case `buffer` is `NULL`.

Parameters

- `item[borrow]` - A data item
- `buffer[out]` - Buffer containing the result
- `buffer_size[out]` - Size of the `buffer`

Type-specific serializers

In case you know the type of the item you want to serialize beforehand, you can use one of the type-specific serializers.

Note: Unless compiled in debug mode, these do not verify the type. Passing an incorrect item will result in an undefined behavior.

---

size_t **cbor_serialize_uint**(**const** *cbor_item_t* *, cbor_mutable_data, size_t)
Serialize an uint.

Return

Length of the result. 0 on failure.

Parameters

- `item[borrow]` - A uint
- `buffer` - Buffer to serialize to
- `buffer_size` - Size of the `buffer`

size_t **cbor_serialize_negint**(**const** *cbor_item_t* *, cbor_mutable_data, size_t)
Serialize a negint.

Return

Length of the result. 0 on failure.

Parameters

- `item[borrow]` - A neging
- `buffer` - Buffer to serialize to
- `buffer_size` - Size of the `buffer`

size_t **cbor_serialize_bytestring**(**const** *cbor_item_t* *, cbor_mutable_data, size_t)
Serialize a bytestring.

Return

Length of the result. 0 on failure.

Parameters

- `item[borrow]` - A bytestring
- `buffer` - Buffer to serialize to
- `buffer_size` - Size of the `buffer`

size_t **cbor_serialize_string**(**const** *cbor_item_t* *, cbor_mutable_data, size_t)
Serialize a string.

Return

Length of the result. 0 on failure.

Parameters

- `item[borrow]` - A string
- `buffer` - Buffer to serialize to
- `buffer_size` - Size of the `buffer`

size_t **cbor_serialize_array**(**const** *cbor_item_t* *, cbor_mutable_data, size_t)
Serialize an array.

Return

Length of the result. 0 on failure.

Parameters

- `item[borrow]` - An array
- `buffer` - Buffer to serialize to
- `buffer_size` - Size of the `buffer`

size_t **cbor_serialize_map**(**const** *cbor_item_t* *, cbor_mutable_data, size_t)
Serialize a map.

Return

Length of the result. 0 on failure.

Parameters

- `item[borrow]` - A map
- `buffer` - Buffer to serialize to
- `buffer_size` - Size of the `buffer`

size_t **`cbor_serialize_tag`**(**const** *cbor_item_t* *, cbor_mutable_data, size_t)
Serialize a tag.

Return

Length of the result. 0 on failure.

Parameters

- `item[borrow]` - A tag
- `buffer` - Buffer to serialize to
- `buffer_size` - Size of the `buffer`

size_t **`cbor_serialize_float_ctrl`**(**const** *cbor_item_t* *, cbor_mutable_data, size_t)
Serialize a.

Return

Length of the result. 0 on failure.

Parameters

- `item[borrow]` - A float or ctrl
- `buffer` - Buffer to serialize to
- `buffer_size` - Size of the `buffer`

2.3.5 Types 0 & 1 – Positive and negative integers

CBOR has two types of integers – positive (which may be effectively regarded as unsigned), and negative. There are four possible widths for an integer – 1, 2, 4, or 8 bytes. These are represented by

enum `cbor_int_width`
Possible widths of *CBOR_TYPE_UINT* items.

Values:

`CBOR_INT_8`

`CBOR_INT_16`

`CBOR_INT_32`

`CBOR_INT_64`

Type 0 - positive integers

Corresponding *cbor_type*	`CBOR_TYPE_UINT`
Number of allocations	One per lifetime
Storage requirements	`sizeof(cbor_item_t) + sizeof(uint*_t)`

Note: once a positive integer has been created, its width *cannot* be changed.

Type 1 - negative integers

Corresponding *cbor_type*	`CBOR_TYPE_NEGINT`
Number of allocations	One per lifetime
Storage requirements	`sizeof(cbor_item_t) + sizeof(uint*_t)`

Note: once a positive integer has been created, its width *cannot* be changed.

Type 0 & 1

Due to their largely similar semantics, the following functions can be used for both Type 0 and Type 1 items. One can convert between them freely using *the conversion functions*.

Actual Type of the integer can be checked using item types API.

An integer item is created with one of the four widths. Because integers' storage is bundled together with the handle, the width cannot be changed over its lifetime.

Warning: Due to the fact that CBOR negative integers represent integers in the range $[-1, -2^N]$, `cbor_set_uint` API is somewhat counter-intuitive as the resulting logical value is 1 less. This behavior is necessary in order to permit uniform manipulation with the full range of permitted values. For example, the following snippet

```
cbor_item_t * item = cbor_new_int8();
cbor_mark_negint(item);
cbor_set_uint8(0);
```

will produce an item with the logical value of -1. There is, however, an upside to this as well: There is only one representation of zero.

Building new items

cbor_item_t ***cbor_build_uint8**(uint8_t *value*)
Constructs a new positive integer.

Return

new positive integer

Parameters

- `value` - the value to use

cbor_item_t ***cbor_build_uint16**(uint16_t *value*)
Constructs a new positive integer.

Return

new positive integer

Parameters

- `value` - the value to use

cbor_item_t ***cbor_build_uint32**(uint32_t *value*)
Constructs a new positive integer.

Return

new positive integer

Parameters

- `value` - the value to use

cbor_item_t ***cbor_build_uint64**(uint64_t *value*)
Constructs a new positive integer.

Return

new positive integer

Parameters

- `value` - the value to use

Retrieving values

uint8_t **cbor_get_uint8**(**const** *cbor_item_t* **item*)
Extracts the integer value.

Return

the value

Parameters

- `item[borrow]` - positive or negative integer

uint16_t **cbor_get_uint16**(**const** *cbor_item_t* **item*)
Extracts the integer value.

Return

the value

Parameters

- `item[borrow]` - positive or negative integer

uint32_t **cbor_get_uint32**(**const** *cbor_item_t* **item*)
Extracts the integer value.

Return

the value

Parameters

- `item[borrow]` - positive or negative integer

uint64_t **cbor_get_uint64**(**const** *cbor_item_t* **item*)
Extracts the integer value.

Return

the value

Parameters

- `item[borrow]` - positive or negative integer

Setting values

void **cbor_set_uint8**(*cbor_item_t* **item*, uint8_t *value*)
Assigns the integer value.

Parameters

- `item[borrow]` - positive or negative integer item
- `value` - the value to assign. For negative integer, the logical value is `-value - 1`

void **cbor_set_uint16**(*cbor_item_t* **item*, uint16_t *value*)
Assigns the integer value.

Parameters

- `item[borrow]` - positive or negative integer item
- `value` - the value to assign. For negative integer, the logical value is `-value - 1`

void **cbor_set_uint32**(*cbor_item_t* **item*, uint32_t *value*)
Assigns the integer value.

Parameters

- `item[borrow]` - positive or negative integer item
- `value` - the value to assign. For negative integer, the logical value is `-value - 1`

void **cbor_set_uint64**(*cbor_item_t* **item*, uint64_t *value*)
Assigns the integer value.

Parameters

- `item[borrow]` - positive or negative integer item
- `value` - the value to assign. For negative integer, the logical value is `-value - 1`

Dealing with width

cbor_int_width **cbor_int_get_width**(**const** *cbor_item_t* **item*)
Queries the integer width.

Return

the width

Parameters

- `item[borrow]` - positive or negative integer item

Dealing with signedness

void **cbor_mark_uint**(*cbor_item_t* *item)
Marks the integer item as a positive integer.

The data value is not changed

Parameters

- `item[borrow]` - positive or negative integer item

void **cbor_mark_negint**(*cbor_item_t* *item)
Marks the integer item as a negative integer.

The data value is not changed

Parameters

- `item[borrow]` - positive or negative integer item

Creating new items

cbor_item_t ***cbor_new_int8**()
Allocates new integer with 1B width.

The width cannot be changed once allocated

Return

new positive integer. The value is not initialized.

cbor_item_t ***cbor_new_int16**()
Allocates new integer with 2B width.

The width cannot be changed once allocated

Return

new positive integer. The value is not initialized.

cbor_item_t ***cbor_new_int32**()
Allocates new integer with 4B width.

The width cannot be changed once allocated

Return

new positive integer. The value is not initialized.

cbor_item_t ***cbor_new_int64**()
Allocates new integer with 8B width.

The width cannot be changed once allocated

Return

new positive integer. The value is not initialized.

2.3.6 Type 2 – Byte strings

CBOR byte strings are just (ordered) series of bytes without further interpretation (unless there is a tag). Byte string's length may or may not be known during encoding. These two kinds of byte strings can be distinguished using *cbor_bytestring_is_definite()* and *cbor_bytestring_is_indefinite()* respectively.

In case a byte string is indefinite, it is encoded as a series of definite byte strings. These are called "chunks". For example, the encoded item

```
0xf5            Start indefinite byte string
    0x41        Byte string (1B long)
        0x00
    0x41        Byte string (1B long)
        0xff
    0xff        "Break" control token
```

represents two bytes, `0x00` and `0xff`. This on one hand enables streaming messages even before they are fully generated, but on the other hand it adds more complexity to the client code.

Corresponding *cbor_type*	`CBOR_TYPE_BYTESTRING`
Number of allocations (definite)	One plus any manipulations with the data
Number of allocations (indefinite)	One plus logarithmically many reallocations relative to chunk count
Storage requirements (definite)	`sizeof(cbor_item_t) + length(handle)`
Storage requirements (indefinite)	`sizeof(cbor_item_t) * (1 + chunk_count) + chunks`

Streaming indefinite byte strings

Please refer to Streaming & indefinite items.

Getting metadata

size_t **cbor_bytestring_length**(**const** *cbor_item_t* **item*)

Returns the length of the binary data.

For definite byte strings only

Return

length of the binary data. Zero if no chunk has been attached yet

Parameters

- `item[borrow]` - a definite bytestring

bool **cbor_bytestring_is_definite**(**const** *cbor_item_t* **item*)

Is the byte string definite?

Return

Is the byte string definite?

Parameters

- `item[borrow]` - a byte string

bool **cbor_bytestring_is_indefinite**(**const** *cbor_item_t* *item)
Is the byte string indefinite?

Return

Is the byte string indefinite?

Parameters

- `item[borrow]` - a byte string

size_t **cbor_bytestring_chunk_count**(**const** *cbor_item_t* *item)
Get the number of chunks this string consist of.

Return

The chunk count. 0 for freshly created items.

Parameters

- `item[borrow]` - A indefinite bytestring

Reading data

cbor_mutable_data **cbor_bytestring_handle**(**const** *cbor_item_t* *item)
Get the handle to the binary data.

Definite items only. Modifying the data is allowed. In that case, the caller takes responsibility for the effect on items this item might be a part of

Return

The address of the binary data. `NULL` if no data have been assigned yet.

Parameters

- `item[borrow]` - A definite byte string

cbor_item_t ****cbor_bytestring_chunks_handle**(**const** *cbor_item_t* *item)
Get the handle to the array of chunks.

Manipulations with the memory block (e.g. sorting it) are allowed, but the validity and the number of chunks must be retained.

Return

array of *cbor_bytestring_chunk_count* definite bytestrings

Parameters

- `item[borrow]` - A indefinite byte string

Creating new items

cbor_item_t ***cbor_new_definite_bytestring**()
Creates a new definite byte string.

The handle is initialized to `NULL` and length to 0

Return

new definite bytestring. `NULL` on malloc failure.

cbor_item_t ***cbor_new_indefinite_bytestring**()
Creates a new indefinite byte string.

The chunks array is initialized to `NULL` and chunkcount to 0

Return

new indefinite bytestring. `NULL` on malloc failure.

Building items

cbor_item_t ***cbor_build_bytestring**(cbor_data *handle*, size_t *length*)
Creates a new byte string and initializes it.

The `handle` will be copied to a newly allocated block

Return

A **new** byte string with content `handle`. `NULL` on malloc failure.

Parameters

- `handle` - Block of binary data
- `length` - Length of `data`

Manipulating existing items

void **cbor_bytestring_set_handle**(*cbor_item_t* **item*, cbor_mutable_data *data*, size_t *length*)
Set the handle to the binary data.

Parameters

- `item[borrow]` - A definite byte string
- `data` - The memory block. The caller gives up the ownership of the block. libcbor will deallocate it when appropriate using its free function
- `length` - Length of the data block

bool **cbor_bytestring_add_chunk**(*cbor_item_t* **item*, *cbor_item_t* **chunk*)
Appends a chunk to the bytestring.

Indefinite byte strings only.

May realloc the chunk storage.

Return

true on success, false on realloc failure. In that case, the refcount of `chunk` is not increased and the `item` is left intact.

Parameters

- `item[borrow]` - An indefinite byte string
- `item[incref]` - A definite byte string

2.3.7 Type 3 – UTF-8 strings

CBOR strings work in much the same ways as Type 2 – Byte strings.

Corresponding *cbor_type*	`CBOR_TYPE_STRING`
Number of allocations (definite)	One plus any manipulations with the data
Number of allocations (indefinite)	One plus logarithmically many reallocations relative to chunk count
Storage requirements (definite)	`sizeof(cbor_item_t) + length(handle)`
Storage requirements (indefinite)	`sizeof(cbor_item_t) * (1 + chunk_count) + chunks`

Streaming indefinite strings

Please refer to Streaming & indefinite items.

UTF-8 encoding validation

libcbor considers UTF-8 encoding validity to be a part of the well-formedness notion of CBOR and therefore invalid UTF-8 strings will be rejected by the parser. Strings created by the user are not checked.

Getting metadata

size_t **`cbor_string_length`**(**const** *cbor_item_t* **item*)
Returns the length of the underlying string.

For definite strings only

Return

length of the string. Zero if no chunk has been attached yet

Parameters

- `item[borrow]` - a definite string

bool **`cbor_string_is_definite`**(**const** *cbor_item_t* **item*)
Is the string definite?

Return

Is the string definite?

Parameters

- `item[borrow]` - a string

bool **`cbor_string_is_indefinite`**(**const** *cbor_item_t* **item*)
Is the string indefinite?

Return

Is the string indefinite?

Parameters

- `item[borrow]` - a string

size_t **cbor_string_chunk_count**(**const** *cbor_item_t* *item)
Get the number of chunks this string consist of.

Return

The chunk count. 0 for freshly created items.

Parameters

- `item[borrow]` - A indefinite string

Reading data

cbor_mutable_data **cbor_string_handle**(**const** *cbor_item_t* *item)
Get the handle to the underlying string.

Definite items only. Modifying the data is allowed. In that case, the caller takes responsibility for the effect on items this item might be a part of

Return

The address of the underlying string. `NULL` if no data have been assigned yet.

Parameters

- `item[borrow]` - A definite string

cbor_item_t ****cbor_string_chunks_handle**(**const** *cbor_item_t* *item)
Get the handle to the array of chunks.

Manipulations with the memory block (e.g. sorting it) are allowed, but the validity and the number of chunks must be retained.

Return

array of *cbor_string_chunk_count* definite strings

Parameters

- `item[borrow]` - A indefinite string

Creating new items

cbor_item_t ***cbor_new_definite_string**()
Creates a new definite string.

The handle is initialized to `NULL` and length to 0

Return

new definite string. `NULL` on malloc failure.

cbor_item_t ***cbor_new_indefinite_string**()
Creates a new indefinite string.

The chunks array is initialized to `NULL` and chunkcount to 0

Return

new indefinite string. `NULL` on malloc failure.

Building items

cbor_item_t ***cbor_build_string**(**const** char **val*)
Creates a new string and initializes it.

The `handle` will be copied to a newly allocated block

Return

A **new** string with content `handle`. `NULL` on malloc failure.

Parameters

- `val` - A null-terminated UTF-8 string

Manipulating existing items

void **cbor_string_set_handle**(*cbor_item_t* **item*, cbor_mutable_data *data*, size_t *length*)
Set the handle to the underlying string.

> **Warning:** Using a pointer to a stack allocated constant is a common mistake. Lifetime of the string will expire when it goes out of scope and the CBOR item will be left inconsistent.

Parameters

- `item[borrow]` - A definite string
- `data` - The memory block. The caller gives up the ownership of the block. libcbor will deallocate it when appropriate using its free function
- `length` - Length of the data block

bool **cbor_string_add_chunk**(*cbor_item_t* **item*, *cbor_item_t* **chunk*)
Appends a chunk to the string.

Indefinite strings only.

May realloc the chunk storage.

Return

true on success. false on realloc failure. In that case, the refcount of `chunk` is not increased and the `item` is left intact.

Parameters

- `item[borrow]` - An indefinite string
- `item[incref]` - A definite string

2.3.8 Type 4 – Arrays

CBOR arrays, just like byte strings and strings, can be encoded either as definite, or as indefinite.

Corresponding *cbor_type*	`CBOR_TYPE_ARRAY`
Number of allocations (definite)	Two plus any manipulations with the data
Number of allocations (indefinite)	Two plus logarithmically many reallocations relative to additions
Storage requirements (definite)	`(sizeof(cbor_item_t) + 1) * size`
Storage requirements (indefinite)	`<= sizeof(cbor_item_t) + sizeof(cbor_item_t) * size * BUFFER_GROWTH`

Examples

```
0x9f        Start indefinite array
    0x01        Unsigned integer 1
    0xff        "Break" control token
```

```
0x9f        Start array, 1B length follows
0x20        Unsigned integer 32
    ...        32 items follow
```

Streaming indefinite arrays

Please refer to Streaming & indefinite items.

Getting metadata

size_t **cbor_array_size**(**const** *cbor_item_t* **item*)
Get the number of members.

Return

The number of members

Parameters

- `item[borrow]` - An array

size_t **cbor_array_allocated**(**const** *cbor_item_t* **item*)
Get the size of the allocated storage.

Return

The size of the allocated storage (number of items)

Parameters

- `item[borrow]` - An array

bool **cbor_array_is_definite**(**const** *cbor_item_t* **item*)
Is the array definite?

Return

Is the array definite?

Parameters

- `item[borrow]` - An array

bool **cbor_array_is_indefinite**(**const** *cbor_item_t* **item*)
Is the array indefinite?

Return

Is the array indefinite?

Parameters

- `item[borrow]` - An array

Reading data

cbor_item_t ***cbor_array_handle**(**const** *cbor_item_t* **item*)
Get the array contents.

The items may be reordered and modified as long as references remain consistent.

Return

cbor_array_size items

Parameters

- `item[borrow]` - An array

cbor_item_t ***cbor_array_get**(**const** *cbor_item_t* **item*, size_t *index*)
Get item by index.

Return

incref The item, or `NULL` in case of boundary violation

Parameters

- `item[borrow]` - An array
- `index` - The index

Creating new items

cbor_item_t ***cbor_new_definite_array**(**const** size_t *size*)
Create new definite array.

Return

new array or `NULL` upon malloc failure

Parameters

- `size` - Number of slots to preallocate

cbor_item_t ***cbor_new_indefinite_array**()
Create new indefinite array.

Return

new array or `NULL` upon malloc failure

Modifying items

bool **cbor_array_push** (*cbor_item_t *array*, *cbor_item_t *pushee*)
Append to the end.

For indefinite items, storage may be realloacted. For definite items, only the preallocated capacity is available.

Return

true on success, false on failure

Parameters

- `array[borrow]` - An array
- `pushee[incref]` - The item to push

bool **cbor_array_replace** (*cbor_item_t *item*, size_t *index*, *cbor_item_t *value*)
Replace item at an index.

The item being replace will be *cbor_decref* 'ed.

Return

true on success, false on allocation failure.

Parameters

- `item[borrow]` - An array
- `value[incref]` - The item to assign
- `index` - The index

bool **cbor_array_set** (*cbor_item_t *item*, size_t *index*, *cbor_item_t *value*)
Set item by index.

Creating arrays with holes is not possible

Return

true on success, false on allocation failure.

Parameters

- `item[borrow]` - An array
- `value[incref]` - The item to assign
- `index` - The index

2.3.9 Type 5 – Maps

CBOR maps are the plain old associate hash maps known from JSON and many other formats and languages, with one exception: any CBOR data item can be a key, not just strings. This is somewhat unusual and you, as an application developer, should keep that in mind.

Maps can be either definite or indefinite, in much the same way as Type 4 – Arrays.

Corresponding *cbor_type*	`CBOR_TYPE_MAP`
Number of allocations (definite)	Two plus any manipulations with the data
Number of allocations (indefinite)	Two plus logarithmically many reallocations relative to additions
Storage requirements (definite)	`sizeof(cbor_pair) * size + sizeof(cbor_item_t)`
Storage requirements (indefinite)	`<= sizeof(cbor_item_t) + sizeof(cbor_pair) * size * BUFFER_GROWTH`

Streaming maps

Please refer to Streaming & indefinite items.

Getting metadata

size_t **cbor_map_size**(**const** *cbor_item_t* **item*)
Get the number of pairs.

Return

The number of pairs

Parameters

- `item[borrow]` - A map

size_t **cbor_map_allocated**(**const** *cbor_item_t* **item*)
Get the size of the allocated storage.

Return

Allocated storage size (as the number of cbor_pair items)

Parameters

- `item[borrow]` - A map

bool **cbor_map_is_definite**(**const** *cbor_item_t* **item*)
Is this map definite?

Return

Is this map definite?

Parameters

- `item[borrow]` - A map

bool **cbor_map_is_indefinite**(**const** *cbor_item_t* **item*)
Is this map indefinite?

Return

Is this map indefinite?

Parameters

- `item[borrow]` - A map

Reading data

struct cbor_pair ***cbor_map_handle**(**const** *cbor_item_t* **item*)
Get the pairs storage.

Return

Array of *cbor_map_size* pairs. Manipulation is possible as long as references remain valid.

Parameters

- `item[borrow]` - A map

Creating new items

cbor_item_t ***cbor_new_definite_map**(**const** size_t *size*)
Create a new definite map.

Return

new definite map. `NULL` on malloc failure.

Parameters

- `size` - The number of slots to preallocate

cbor_item_t ***cbor_new_indefinite_map**()
Create a new indefinite map.

Return

new definite map. `NULL` on malloc failure.

Parameters

- `size` - The number of slots to preallocate

Modifying items

bool **cbor_map_add**(*cbor_item_t* **item*, **struct** cbor_pair *pair*)
Add a pair to the map.

For definite maps, items can only be added to the preallocated space. For indefinite maps, the storage will be expanded as needed

Return

`true` on success, `false` if either reallocation failed or the preallcoated storage is full

Parameters

- `item[borrow]` - A map
- `pair[incref]` - The key-value pair to add

2.3.10 Type 6 – Semantic tags

Tag are additional metadata that can be used to extend or specialize the meaning or interpretation of the other data items.

For example, one might tag an array of numbers to communicate that it should be interpreted as a vector.

Please consult the official IANA repository of CBOR tags before inventing new ones.

cbor_item_t ***cbor_new_tag**(uint64_t *value*)
Create a new tag.

Return

new tag. Item reference is `NULL`.

Parameters

- `value` - The tag value. Please consult the tag repository

cbor_item_t ***cbor_tag_item**(**const** *cbor_item_t *item*)
Get the tagged item.

Return

incref the tagged item

Parameters

- `item[borrow]` - A tag

uint64_t **cbor_tag_value**(**const** *cbor_item_t *item*)
Get tag value.

Return

The tag value. Please consult the tag repository

Parameters

- `item[borrow]` - A tag

void **cbor_tag_set_item**(*cbor_item_t *item*, *cbor_item_t *tagged_item*)
Set the tagged item.

Parameters

- `item[borrow]` - A tag
- `tagged_item[incref]` - The item to tag

2.3.11 Type 7 – Floats & control tokens

This type combines two completely unrelated types of items – floating point numbers and special values such as true, false, null, etc. We refer to these special values as 'control values' or 'ctrls' for short throughout the code.

Just like integers, they have different possible width (resulting in different value ranges and precisions).

enum cbor_float_width
Possible widths of *CBOR_TYPE_FLOAT_CTRL* items.

Values:

CBOR_FLOAT_0
Internal use - ctrl and special values.

CBOR_FLOAT_16
Half float.

CBOR_FLOAT_32
Single float.

CBOR_FLOAT_64
Double.

Corresponding *cbor_type*	`CBOR_TYPE_FLOAT_CTRL`
Number of allocations	One per lifetime
Storage requirements	`sizeof(cbor_item_t) + 1/4/8`

Getting metadata

bool **cbor_float_ctrl_is_ctrl**(**const** *cbor_item_t* **item*)
Is this a ctrl value?

Return

Is this a ctrl value?

Parameters

- `item[borrow]` - A float or ctrl item

cbor_float_width **cbor_float_get_width**(**const** *cbor_item_t* **item*)
Get the float width.

Return

The width.

Parameters

- `item[borrow]` - A float or ctrl item

bool **cbor_ctrl_is_bool**(**const** *cbor_item_t* **item*)
Is this ctrl item a boolean?

Return

Is this ctrl item a boolean?

Parameters

- `item[borrow]` - A ctrl item

Reading data

float **cbor_float_get_float2**(**const** *cbor_item_t* **item*)
Get a half precision float.

The item must have the corresponding width

Return

half precision value

Parameters

- `borrow]` - A half precision float

float **cbor_float_get_float4**(**const** *cbor_item_t* **item*)
Get a single precision float.

The item must have the corresponding width

Return

single precision value

Parameters

- `borrow]` - A signle precision float

double **cbor_float_get_float8**(**const** *cbor_item_t* **item*)
Get a double precision float.

The item must have the corresponding width

Return

double precision value

Parameters

- `borrow]` - A double precision float

double **cbor_float_get_float**(**const** *cbor_item_t* **item*)
Get the float value represented as double.

Can be used regardless of the width.

Return

double precision value

Parameters

- `borrow]` - Any float

uint8_t **cbor_ctrl_value**(**const** *cbor_item_t* **item*)
Reads the control value.

Return

the simple value

Parameters

- `item[borrow]` - A ctrl item

Creating new items

cbor_item_t ***cbor_new_ctrl**()
Constructs a new ctrl item.

The width cannot be changed once the item is created

Return

new 1B ctrl

cbor_item_t ***cbor_new_float2**()
Constructs a new float item.

The width cannot be changed once the item is created

Return

new 2B float

cbor_item_t ***cbor_new_float4**()
Constructs a new float item.

The width cannot be changed once the item is created

Return

new 4B float

cbor_item_t ***cbor_new_float8**()
Constructs a new float item.

The width cannot be changed once the item is created

Return

new 8B float

cbor_item_t ***cbor_new_null**()
Constructs new null ctrl item.

Return

new null ctrl item

cbor_item_t ***cbor_new_undef**()
Constructs new under ctrl item.

Return

new under ctrl item

Building items

cbor_item_t ***cbor_build_bool**(bool *value*)
Constructs new boolean ctrl item.

Return

new boolen ctrl item

Parameters

- `value` - The value to use

Manipulating existing items

void **cbor_set_ctrl** (*cbor_item_t* *item, uint8_t *value*)
Assign a control value.

> **Warning:** It is possible to produce an invalid CBOR value by assigning a invalid value using this mechanism. Please consult the standard before use.

Parameters

- `item[borrow]` - A ctrl item
- `value` - The simple value to assign. Please consult the standard for allowed values

void **cbor_set_float2** (*cbor_item_t* *item, float *value*)
Assigns a float value.

Parameters

- `item[borrow]` - A half precision float
- `value` - The value to assign

void **cbor_set_float4** (*cbor_item_t* *item, float *value*)
Assigns a float value.

Parameters

- `item[borrow]` - A single precision float
- `value` - The value to assign

void **cbor_set_float8** (*cbor_item_t* *item, double *value*)
Assigns a float value.

Parameters

- `item[borrow]` - A double precision float
- `value` - The value to assign

2.4 Streaming & indefinite items

CBOR strings, byte strings, arrays, and maps can be encoded as *indefinite*, meaning their length or size is not specified. Instead, they are divided into *chunks* (strings, byte strings), or explicitly terminated (arrays, maps).

This is one of the most important (and due to poor implementations, underutilized) features of CBOR. It enables low-overhead streaming just about anywhere without dealing with channels or pub/sub mechanism. It is, however, important to recognize that CBOR streaming is not a substitute for Websockets [2] and similar technologies.

2.4.1 Decoding

Another way to decode data using libcbor is to specify a callbacks that will be invoked when upon finding certain items in the input. This service is provided by

struct *cbor_decoder_result* **cbor_stream_decode**(cbor_data *buffer*, size_t *buffer_size*, **const** **struct** *cbor_callbacks* **callbacks*, void **context*)

Stateless decoder.

Will try parsing the `buffer` and will invoke the appropriate callback on success. Decodes one item at a time. No memory allocations occur.

Parameters

- `buffer` - Input buffer
- `buffer_size` - Length of the buffer
- `callbacks` - The callback bundle
- `context` - An arbitrary pointer to allow for maintaining context.

To get started, you might want to have a look at the simple streaming example:

```
#include "cbor.h"
#include <stdio.h>
#include <string.h>

/*
 * Illustrates how one might skim through a map (which is assumed to have
 * string keys and values only), looking for the value of a specific key
 *
 * Use the examples/data/map.cbor input to test this.
 */

const char * key = "a secret key";
bool key_found = false;

void find_string(void * _ctx, cbor_data buffer, size_t len)
{
    if (key_found) {
        printf("Found the value: %*s\n", (int) len, buffer);
        key_found = false;
    } else if (len == strlen(key)) {
        key_found = (memcmp(key, buffer, len) == 0);
    }
}

int main(int argc, char * argv[])
{
    FILE * f = fopen(argv[1], "rb");
    fseek(f, 0, SEEK_END);
    size_t length = (size_t)ftell(f);
```

[2] RFC 6455

```
    fseek(f, 0, SEEK_SET);
    unsigned char * buffer = malloc(length);
    fread(buffer, length, 1, f);

    struct cbor_callbacks callbacks = cbor_empty_callbacks;
    struct cbor_decoder_result decode_result;
    size_t bytes_read = 0;
    callbacks.string = find_string;
    while (bytes_read < length) {
        decode_result = cbor_stream_decode(buffer + bytes_read,
                                           length - bytes_read,
                                           &callbacks, NULL);
        bytes_read += decode_result.read;
    }

    free(buffer);
    fclose(f);
}
```

The callbacks are defined by

struct cbor_callbacks
Callback bundle passed to the decoder.

Public Members

cbor_int64_callback **uint64**
Unsigned int.

cbor_int32_callback **uint32**
Unsigned int.

cbor_int8_callback **uint8**
Unsigned int.

cbor_int16_callback **uint16**
Unsigned int.

cbor_int64_callback **negint64**
Negative int.

cbor_int32_callback **negint32**
Negative int.

cbor_int16_callback **negint16**
Negative int.

cbor_int8_callback **negint8**
Negative int.

cbor_simple_callback **byte_string_start**
Definite byte string.

cbor_string_callback **byte_string**
Indefinite byte string start.

cbor_string_callback **string**
Definite string.

cbor_simple_callback **string_start**
Indefinite string start.

cbor_simple_callback **indef_array_start**
Definite array.

cbor_collection_callback **array_start**
Indefinite array.

cbor_simple_callback **indef_map_start**
Definite map.

cbor_collection_callback **map_start**
Indefinite map.

cbor_int64_callback **tag**
Tags.

cbor_float_callback **float2**
Half float.

cbor_double_callback **float8**
Single float.

cbor_float_callback **float4**
Double float.

cbor_simple_callback **undefined**
Undef.

cbor_simple_callback **null**
Null.

cbor_bool_callback **boolean**
Bool.

cbor_simple_callback **indef_break**
Indefinite item break.

When building custom sets of callbacks, feel free to start from

const struct *cbor_callbacks* **cbor_empty_callbacks**
Dummy callback bundle - does nothing.

Related structures

enum cbor_decoder_status
Streaming decoder result - status.

Values:

CBOR_DECODER_FINISHED
OK, finished.

CBOR_DECODER_NEDATA
Not enough data - mismatch with MTB.

CBOR_DECODER_EBUFFER
Buffer manipulation problem.

CBOR_DECODER_ERROR
Malformed or reserved MTB/value.

struct cbor_decoder_result
Streaming decoder result.

Public Members

size_t **read**
Bytes read.

cbor_decoder_status **status**
The result.

Callback types definition

typedef void (*__cbor_int8_callback__)(void *, uint8_t)
Callback prototype.

Callback prototype.

2.4.2 Encoding

TODO

2.5 Tests

2.5.1 Unit tests

There is a comprehensive test suite employing CMocka. You can run all of them using `ctest` in the build directory. Individual tests are themselves runnable. Please refer to CTest documentation for detailed information on how to specify particular subset of tests.

2.5.2 Testing for memory leaks

Every release is tested for memory correctness. You can run these tests by passing the `-T memcheck` flag to `ctest`. [3]

2.5.3 Code coverage

Every release is inspected using GCOV/LCOV. Platform-independent code should be fully covered by the test suite. Simply run

```
make coverage
```

or alternatively run `lcov` by hand using

```
lcov --capture --directory . --output-file coverage.info
genhtml coverage.info --output-directory out
```

2.5.4 Fuzz testing

Every release is tested using a fuzz test. In this test, a huge buffer filled with random data is passed to the decoder. We require that it either succeeds or fail with a sensible error, without leaking any memory. This is intended to simulate real-world situations where data received from the network are CBOR-decoded before any further processing.

2.6 RFC conformance

libcbor is, generally speaking, very faithful implementation of RFC 7049. There are, however, some limitations imposed by technical constraints.

2.6.1 Bytestring length

There is no explicit limitation of indefinite length byte strings. [4] *libcbor* will not handle byte strings with more chunks than the maximum value of `size_t`. On any sane platform, such string would not fit in the memory anyway. It is, however, possible to process arbitrarily long strings and byte strings using the streaming decoder.

2.6.2 "Half-precision" IEEE 754 floats

As of C11, there is no standard implementation for 2 bytes floats. *libcbor* packs them as a `double`. When encoding, *libcbor* selects the appropriate wire representation based on metadata and the actual value. This applies both to canonical and normal mode.

2.7 Internal mechanics

Internal workings of *libcbor* are mostly derived from the specification. The purpose of this document is to describe technical choices made during design & implementation and to explicate the reasoning behind those choices.

[3] Project should be configured with `-DCMAKE_BUILD_TYPE=Debug` to obtain meaningful description of location of the leak. You might also need `--dsymutil=yes` on OS X.

[4] http://tools.ietf.org/html/rfc7049#section-2.2.2

2.7.1 Terminology

MTB	Major Type Byte	http://tools.ietf.org/html/rfc7049#section-2.1
DST	Dynamically Sized Type	Type whose storage requirements cannot be determined during compilation (originated in the Rust community)

2.7.2 Conventions

API symbols start with `cbor_` or `CBOR_` prefix, internal symbols have `_cbor_` or `_CBOR_` prefix.

2.7.3 Inspiration & related projects

Most of the API is largely modelled after existing JSON libraries, including

- Jansson
- json-c
- Gnome's JsonGlib

and also borrowing from

- msgpack-c
- Google Protocol Buffers.

2.7.4 General notes on the API design

The API design has two main driving priciples:

1. Let the client manage the memory as much as possible
2. Behave exactly as specified by the standard

Combining these two principles in practice turns out to be quite difficult. Indefinite-length strings, arrays, and maps require client to handle every fixed-size chunk explicitly in order to

- ensure the client never runs out of memory due to *libcbor*
- use `realloc()` sparsely and predictably [5]
  - provide strong guarantees about its usage (to prevent latency spikes)
  - provide APIs to avoid `realloc()` altogether
- allow proper handling of (streamed) data bigger than available memory

2.7.5 Coding style

This code loosely follows the Linux kernel coding style. Tabs are tabs, and they are 4 characters wide.

[5] Reasonable handling of DSTs requires reallocation if the API is to remain sane.

2.7.6 Memory layout

CBOR is very dynamic in the sense that it contains many data elements of variable length, sometimes even indefinite length. This section describes internal representation of all CBOR data types.

Generally speaking, data items consist of three parts:

- a generic *handle*,
- the associated `metadata`,
- and the `actual data`

type cbor_item_t
Represents the item. Used as an opaque type

cbor_type **type**
Type discriminator

size_t **refcount**
Reference counter. Used by *cbor_decref()*, *cbor_incref()*

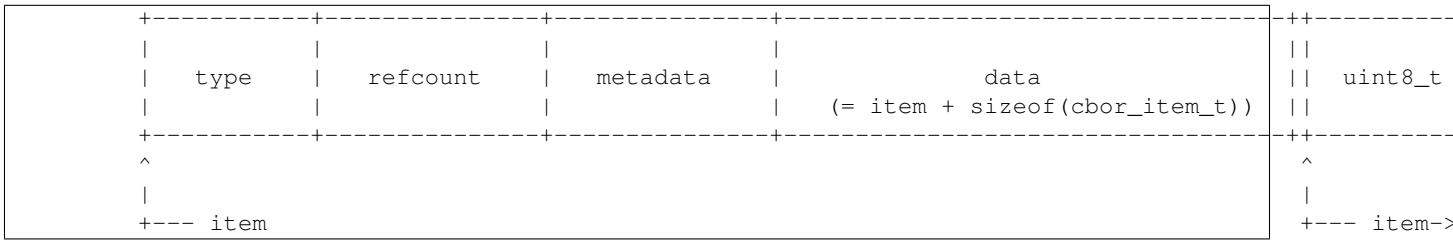
union cbor_item_metadata **metadata**
Union discriminated by `cbor_item_t.type`. Contains type-specific metadata

unsigned char * data
Contains pointer to the actual data. Small, fixed size items (Types 0 & 1 – Positive and negative integers, Type 6 – Semantic tags, Type 7 – Floats & control tokens) are allocated as a single memory block.

Consider the following snippet

```
cbor_item_t * item = cbor_new_int8();
```

then the memory is laid out as follows



Dynamically sized types (Type 2 – Byte strings, Type 3 – UTF-8 strings, Type 4 – Arrays, Type 5 – Maps) may store handle and data in separate locations. This enables creating large items (e.g byte strings) without `realloc()` or copying large blocks of memory. One simply attaches the correct pointer to the handle.

union cbor_item_metadata

struct _cbor_int_metadata int_metadata;
Used both by both Types 0 & 1 – Positive and negative integers

struct _cbor_bytestring_metadata bytestring_metadata;

struct _cbor_string_metadata string_metadata;

struct _cbor_array_metadata array_metadata;

struct _cbor_map_metadata map_metadata;

struct _cbor_tag_metadata tag_metadata;

struct _cbor_float_ctrl_metadata float_ctrl_metadata;

2.7.7 Decoding

As outlined in API, there decoding is based on the streaming decoder Essentially, the decoder is a custom set of callbacks for the streaming decoder.

2.8 Changelog

2.8.1 Next

2.8.2 0.2.0 (2015-05-17)

- *cbor_ctrl_bool* -> *cbor_ctrl_is_bool*
- Added *cbor_array_allocated* & map equivalent
- Overhauled endianess conversion - ARM now works as expected
- 'sort.c' example added
- Significantly improved and doxyfied documentation

2.8.3 0.1.0 (2015-05-06)

The initial release, yay!

2.9 Development

2.9.1 Development dependencies

- CMocka (testing)
- Python and pip (Sphinx platform)
- Doxygen
- Sphinx (documentation)
- There are some Ruby scripts in `misc`
- Valgrind (memory correctness & profiling)
- GCOV/LCOV (test coverage)

Building *cmocka*

```
# Starting from libcbor source directory
git submodule update test/cmocka
cd test
mkdir cmocka_build && cd cmocka_build
cmake ../cmocka
make -j 4
make install
```

Installing *sphinx*

```
pip install sphinx
pip install sphinx_rtd_theme
pip install https://github.com/lepture/python-livereload/archive/master.zip
pip install sphinx-autobuild
```

Further instructions on configuring advanced features can be found at http://read-the-docs.readthedocs.org/en/latest/install.html.

Live preview of docs

```
cd doc
make livehtml
```

Testing and code coverage
